Go to *Tools* and then to *S2Setup*

To begin a new calibration for a new instrument, it is first necessary to set up that instrument. EasyCal functions by creating (and maintaining) folders for each instrument

To use EasyCal, we must maintain those folders

Organize Burn New folder

Name	Date modified	Type	Size
S2	5/1/18 10:14 AM	File folder	
Std SSD	5/1/18 10:14 AM	File folder	

2 items Offline status: Online Offline availability: Not available

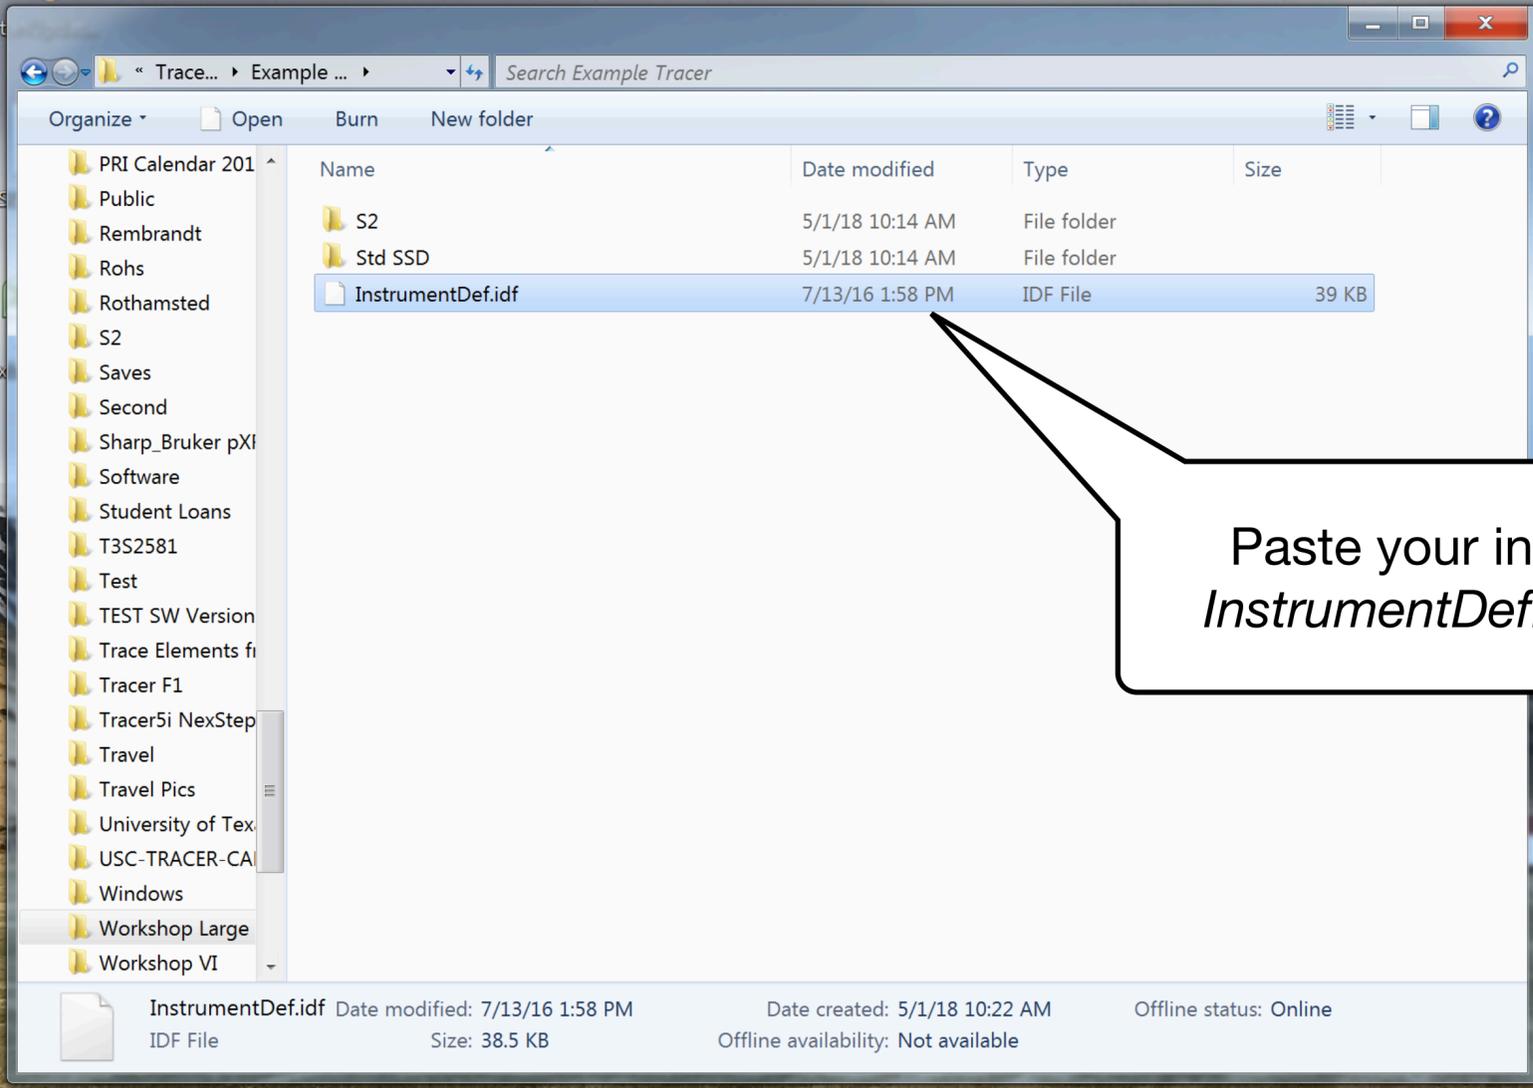

If you go to that folder, you will see that EasyCal created two folders, S2 and Std SSD

Std SSD is where the standards and calibration itself will be stored

Each Tracer, Titan, XMS, and CTX has an *InstrumentDef.idf* file. It is crucial to make sure it is in the calibration folder

It is stored on your instrument itself under / Bruker/InstrumentDef.idf. Copy and paste it using *BIT* or a *USB*

Paste your instrument's *InstrumentDef.idf* file here

- PRI Sampling Manual.pdf

The opening screen will not be very exciting. To get started, we will need to set up a new Calibration

- File View Options Help
- New Application... Ctrl+N
- Open Application... Ctrl+I
- Draft Application... Ctrl+U
- Open Compound Library
- Setup mode
- Print Setup...
- 1 Obsidian.evm
- 2 Mudrock Trace Green.evm
- 3 Mudrock Trace Green.devm
- Exit

Click *File* and then *New Application*

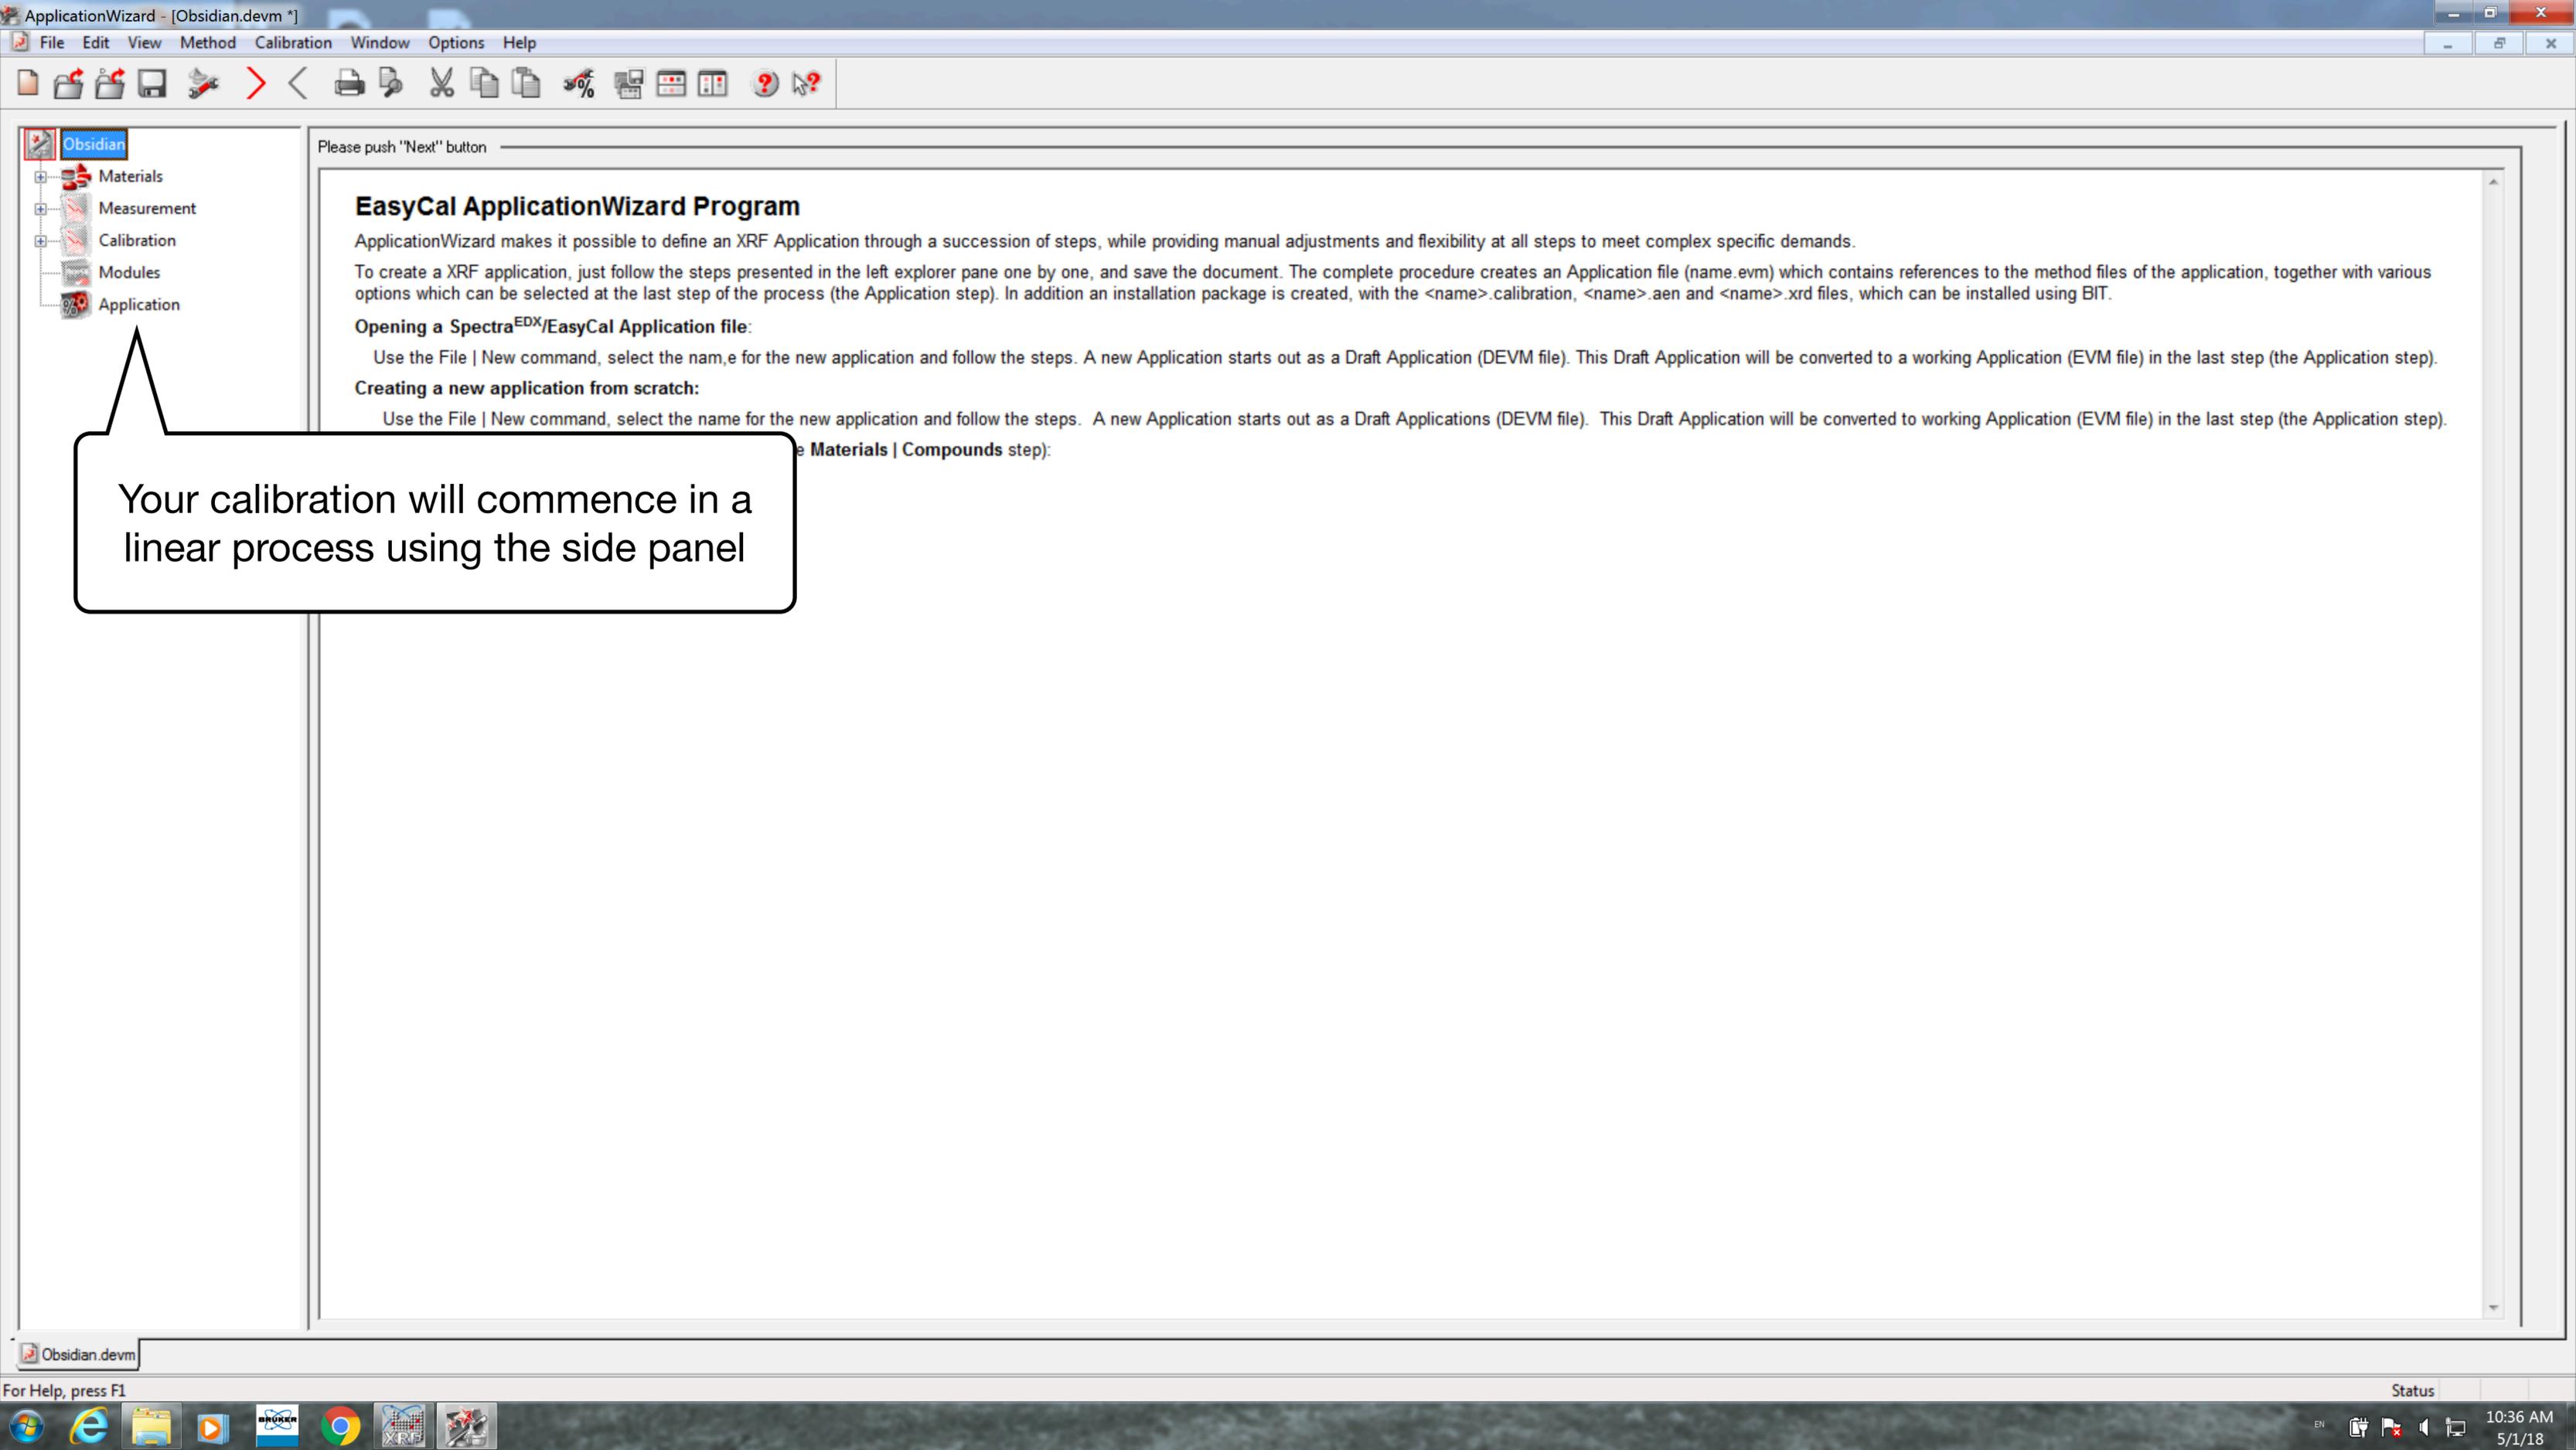

Give your new calibration a name.
Don't worry about normalizations - we
will handle those later

New Application

New application name:

Time based empirical Compton based empirical Sum ROI based empirical

- Obsidian
- Materials
- Measurement
- Calibration
- Modules
- Application

Please push "Next" button

EasyCal ApplicationWizard Program

ApplicationWizard makes it possible to define an XRF Application through a succession of steps, while providing manual adjustments and flexibility at all steps to meet complex specific demands.

To create a XRF application, just follow the steps presented in the left explorer pane one by one, and save the document. The complete procedure creates an Application file (name.evm) which contains references to the method files of the application, together with various options which can be selected at the last step of the process (the Application step). In addition an installation package is created, with the <name>.calibration, <name>.aen and <name>.xrd files, which can be installed using BIT.

Opening a Spectra^{EDX}/EasyCal Application file:

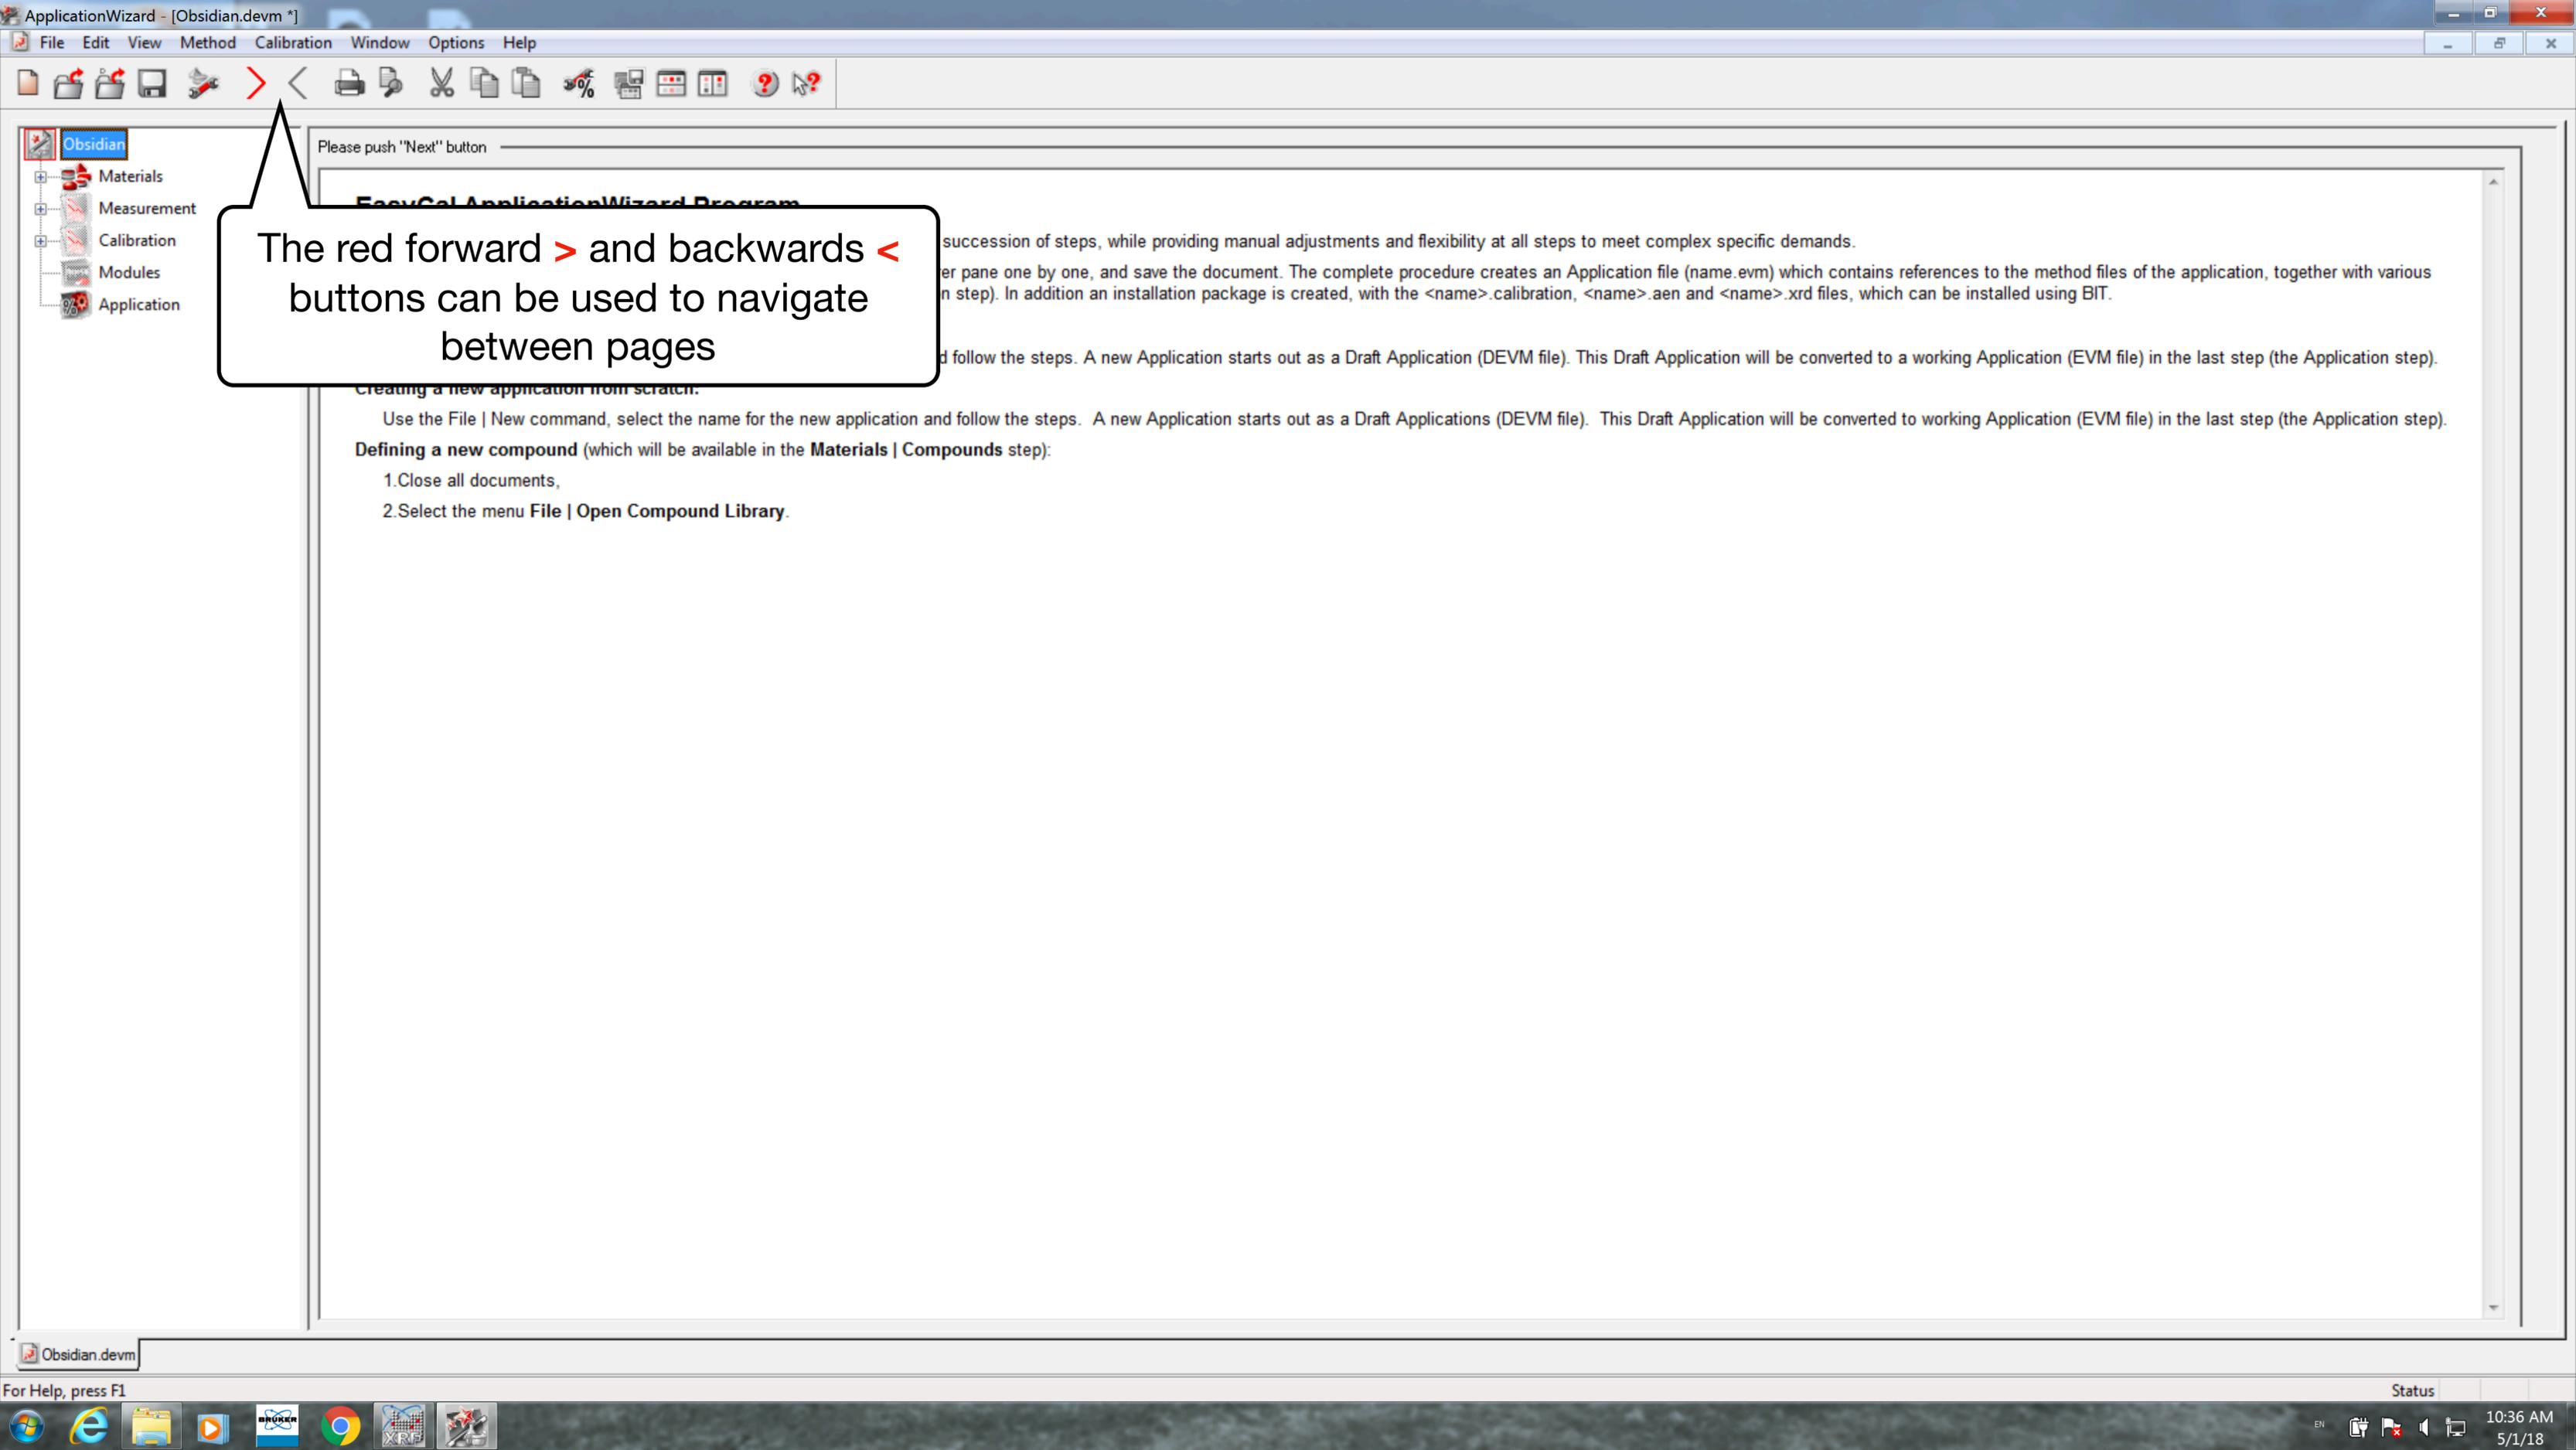

Use the File | New command, select the name for the new application and follow the steps. A new Application starts out as a Draft Application (DEVM file). This Draft Application will be converted to a working Application (EVM file) in the last step (the Application step).

Creating a new application from scratch:

Use the File | New command, select the name for the new application and follow the steps. A new Application starts out as a Draft Applications (DEVM file). This Draft Application will be converted to working Application (EVM file) in the last step (the Application step).

Materials | Compounds step):

Your calibration will commence in a linear process using the side panel

The red forward > and backwards < buttons can be used to navigate between pages

Please push "Next" button

EasyGel Application Wizard Program

succession of steps, while providing manual adjustments and flexibility at all steps to meet complex specific demands. per pane one by one, and save the document. The complete procedure creates an Application file (name.evm) which contains references to the method files of the application, together with various (n step). In addition an installation package is created, with the <name>.calibration, <name>.aen and <name>.xrd files, which can be installed using BIT.

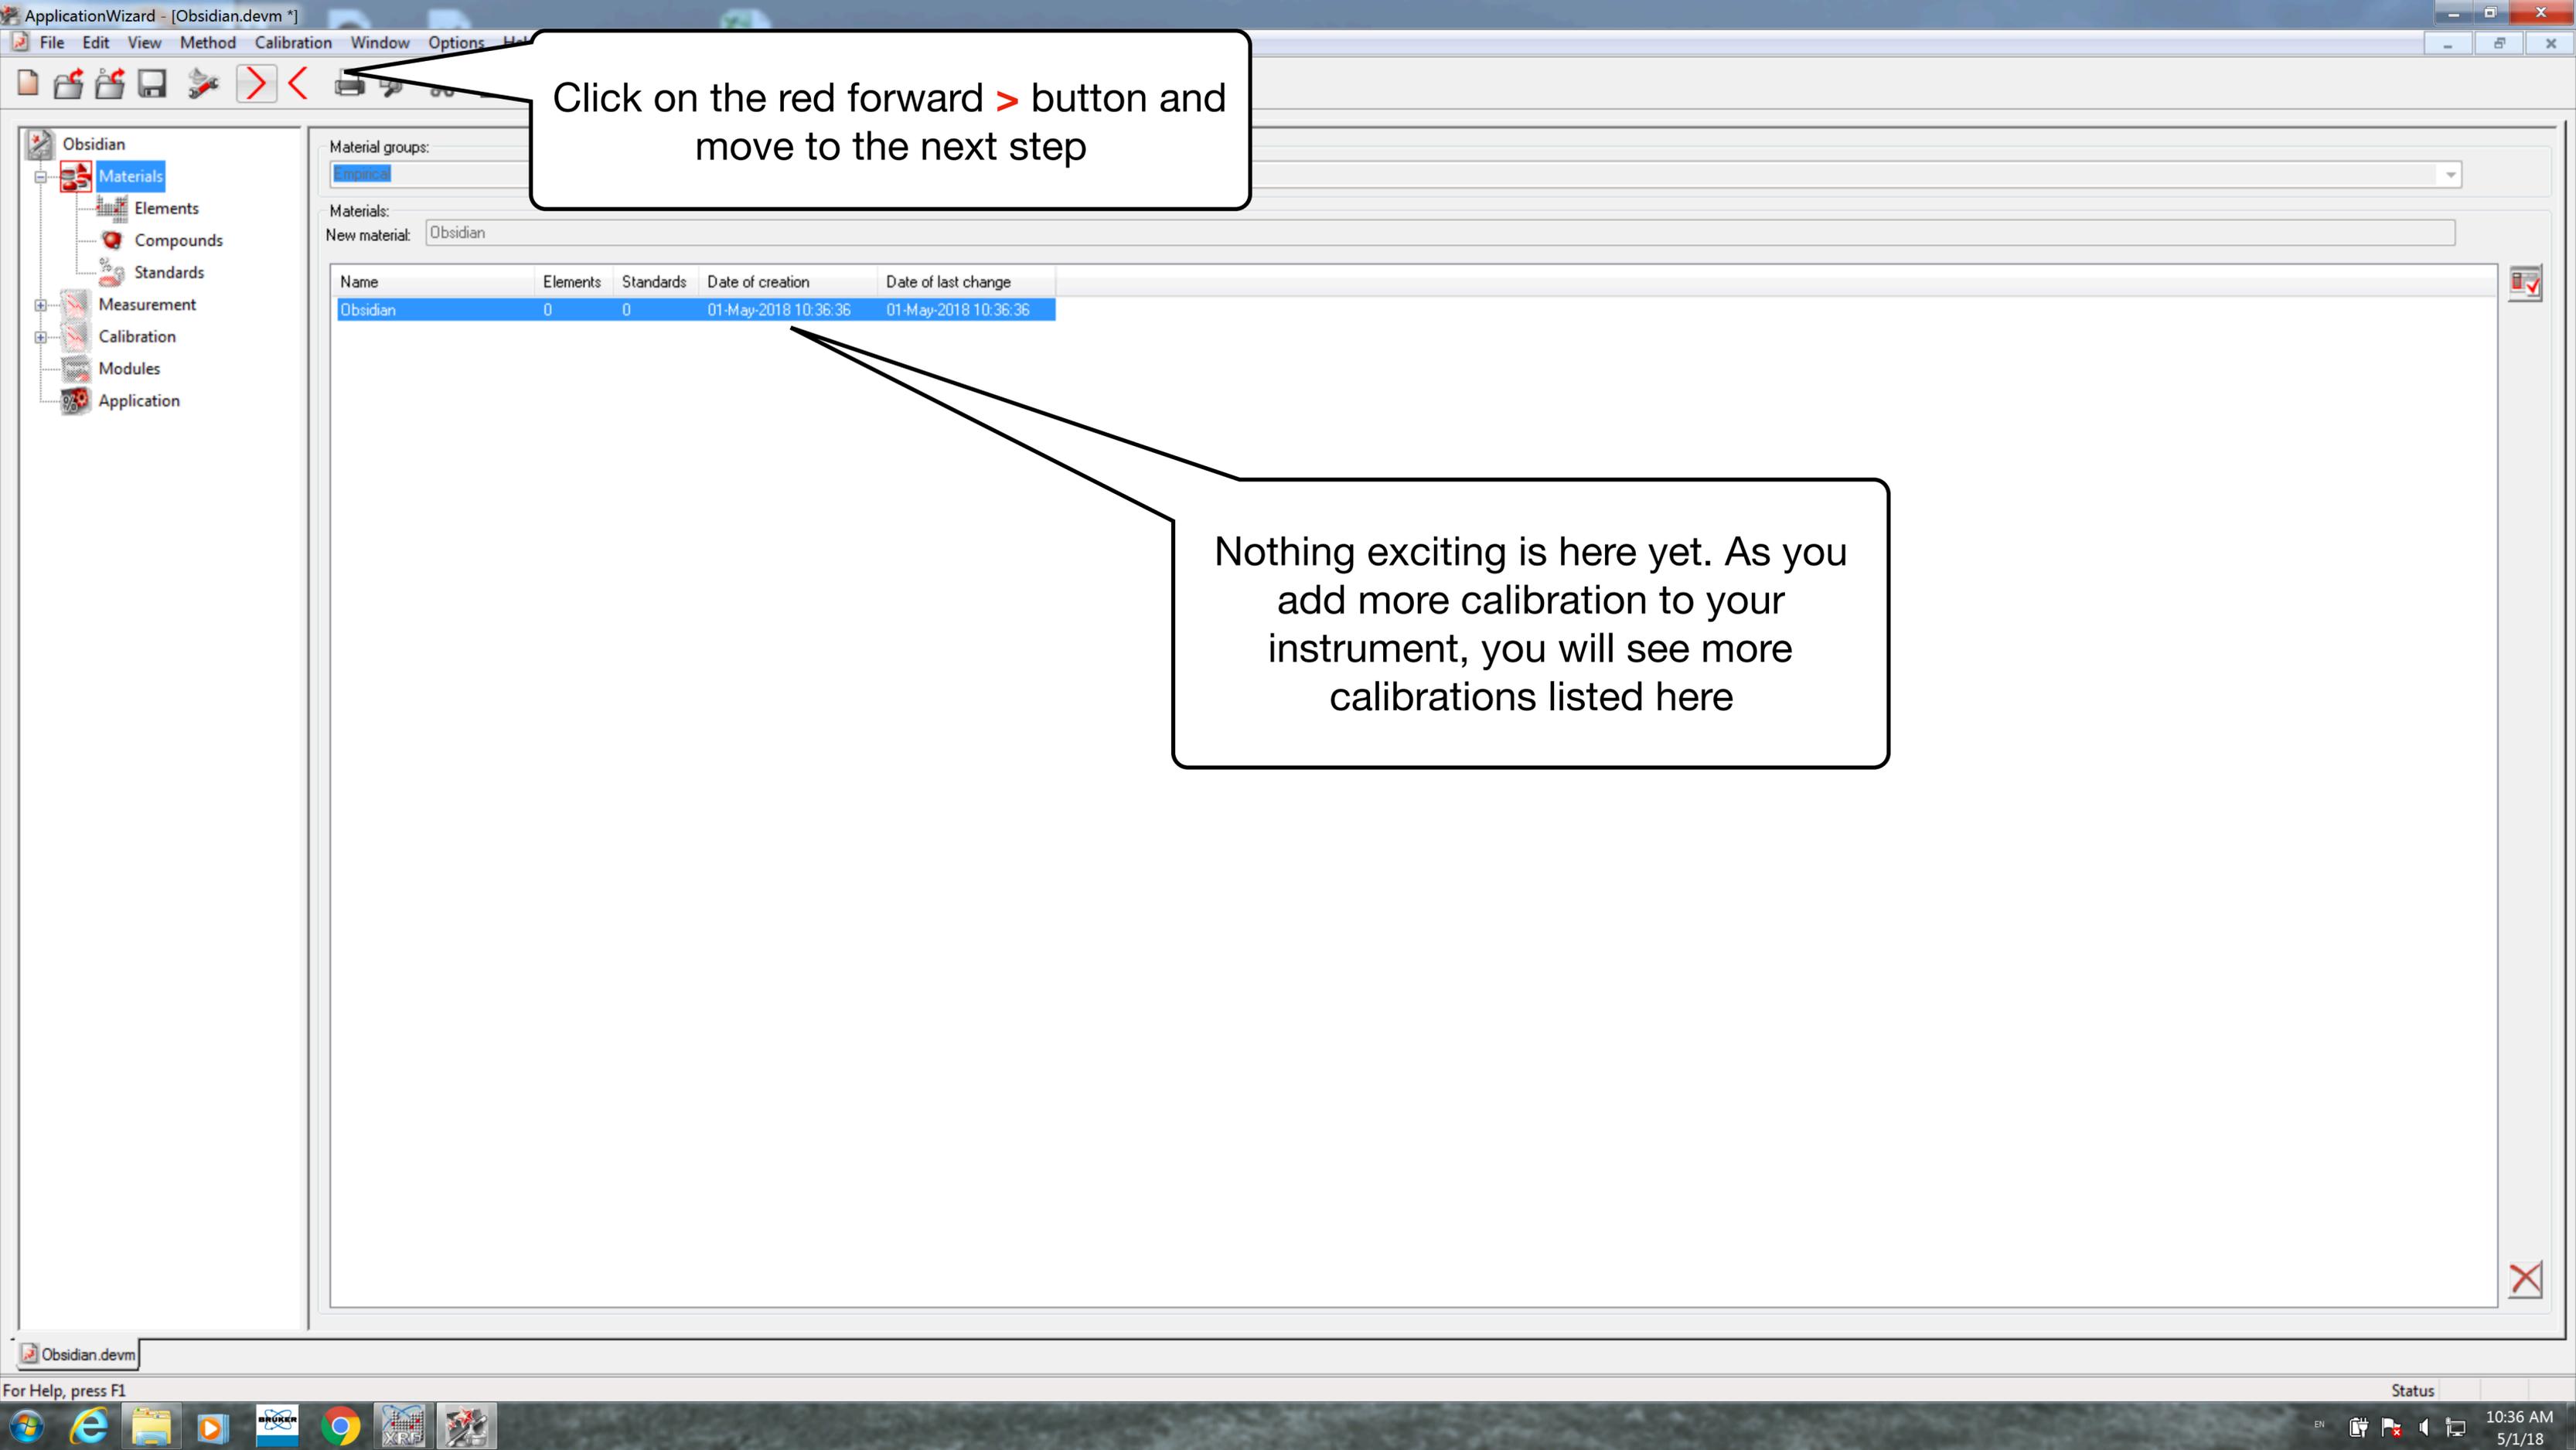

and follow the steps. A new Application starts out as a Draft Application (DEVM file). This Draft Application will be converted to a working Application (EVM file) in the last step (the Application step).

Creating a new application from scratch.

Use the File | New command, select the name for the new application and follow the steps. A new Application starts out as a Draft Applications (DEVM file). This Draft Application will be converted to working Application (EVM file) in the last step (the Application step).

Defining a new compound (which will be available in the Materials | Compounds step):

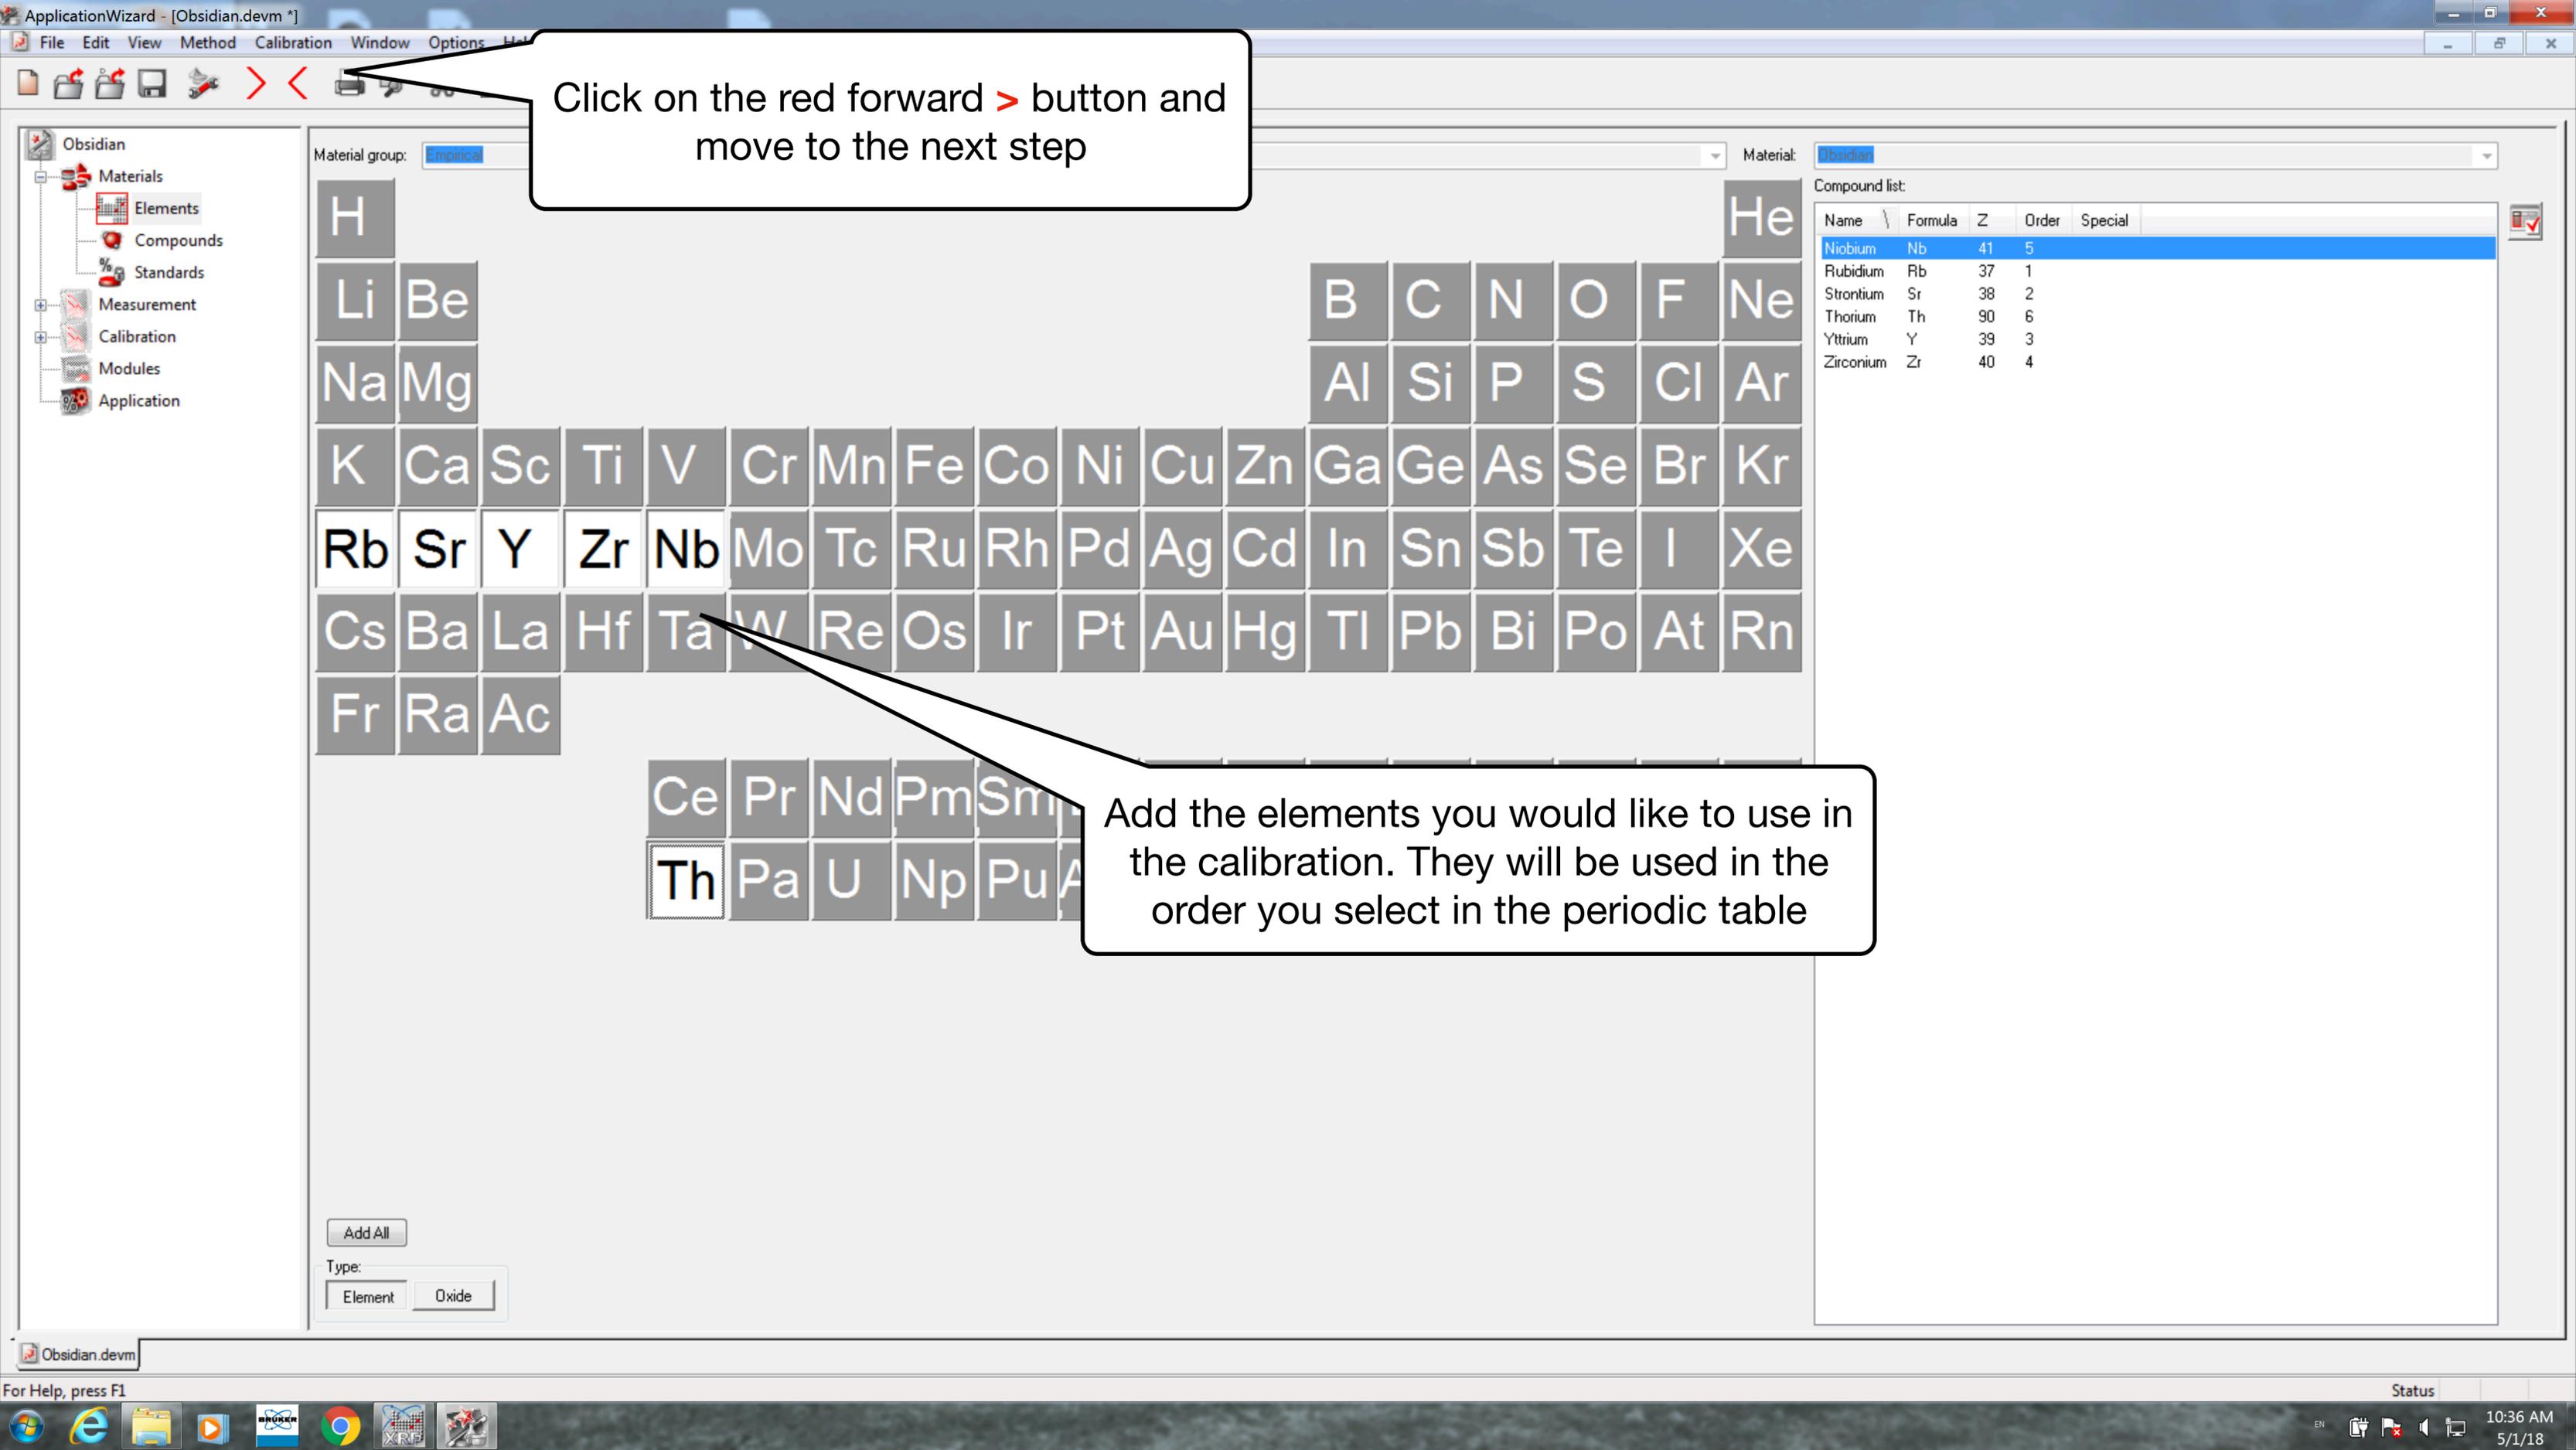

1. Close all documents,
2. Select the menu File | Open Compound Library.

Click on the red forward > button and move to the next step

Nothing exciting is here yet. As you add more calibration to your instrument, you will see more calibrations listed here

Name	Elements	Standards	Date of creation	Date of last change
Obsidian	0	0	01-May-2018 10:36:36	01-May-2018 10:36:36

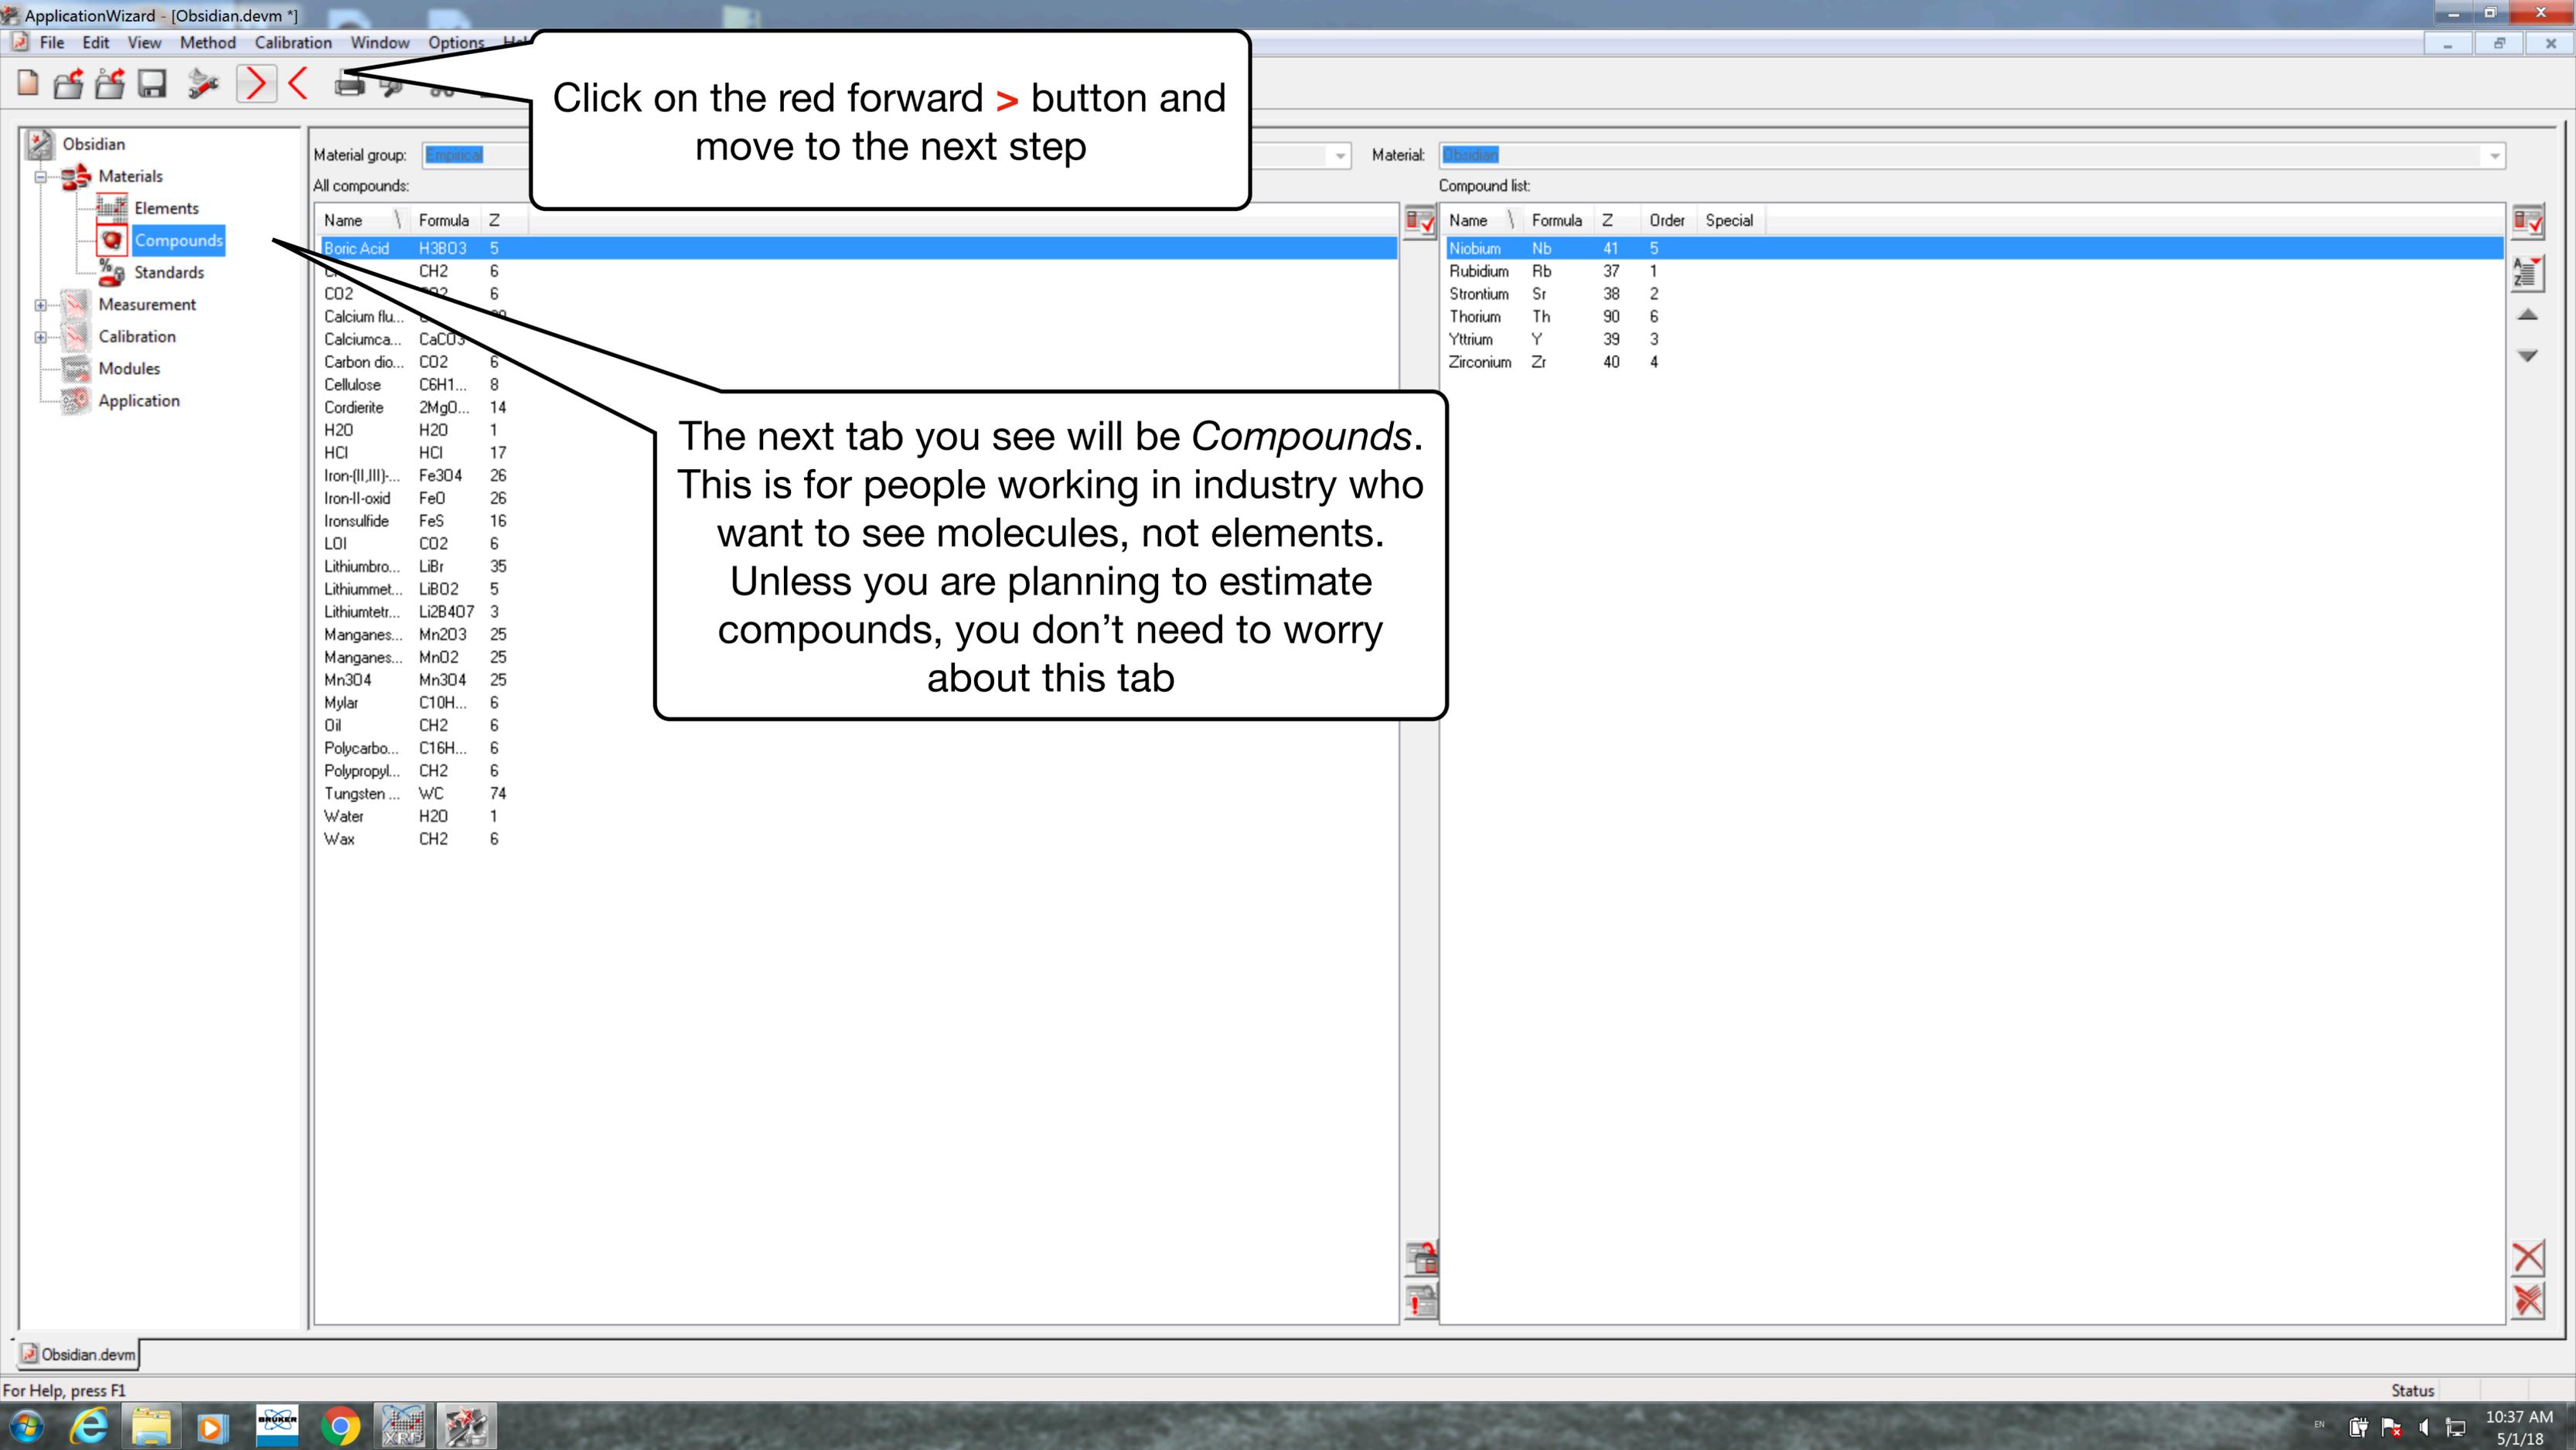

Click on the red forward > button and move to the next step

Add the elements you would like to use in the calibration. They will be used in the order you select in the periodic table

Name	Formula	Z	Order	Special
Niobium	Nb	41	5	
Rubidium	Rb	37	1	
Strontium	Sr	38	2	
Thorium	Th	90	6	
Yttrium	Y	39	3	
Zirconium	Zr	40	4	

Add All
Type:
Element Oxide

Click on the red forward > button and move to the next step

The next tab you see will be *Compounds*. This is for people working in industry who want to see molecules, not elements. Unless you are planning to estimate compounds, you don't need to worry about this tab

Material group: Empirical

I can paste them (ctrl+v) in that element's column here

EasyCal will only accept values in weight %. If your data is in ppm, you will need to convert it over percent, or *per cent*, implies parts-per-100. ppm means parts-per-1000,000. To convert from ppm to percent, just divide by 10,000. That takes you from 6 0s to 4

Automatic U PPM %

Click *Run Order Wizard*

Current method file : Obsidian.s2m
Current material : Obsidian

Run Order Wizard

Purpose
To create a "run order" file associated with this calibration. A run order is a file that automates the collection of spectra for samples.

How?
First use Bruker Instrument Tools to **copy the InstrumentDef.IDF** file from the instrument to the base folder of your EasyCal program. For example to "C:\Users\John\My Documents\Bruker\S1Cal". If you have a Tracer 5ⁱ you will also need to **copy \Bruker\System\ManualFilters.csv** to your base folder.

Then click on **Run Order Wizard** and ApplicationWizard will open Run Order Wizard for you. Once open, choose the appropriate settings and click "OK".

The run order file has a ".csv" extension. It will be saved in the location indicated at the top of the Run Order Wizard program in a folder with the same name as the Calibration. For example "C:\Users\John\My Documents\Bruker\S1Cal\RunOrders\Alloys\Alloys.csv". Note that there are two additional files created in the same directory- S1-LineLibrary.xrd and S1-LineLibrary-A1.fl. Ignore these files.

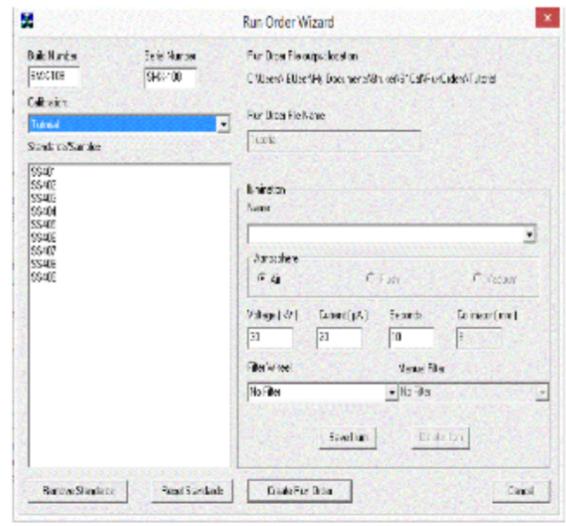

Copy your run order file into a folder called "RunOrders" on a USB drive. You can do this directly by inserting the USB on the PC. Or by using BIT explorer with the USB inserted on the instrument and the instrument connected to the PC.

Insert the USB drive into the instrument.

Use the Run Order utility on the instrument to collect data from your samples. (**Ready-to-Test -> Utilities -> System Setup -> Run Order**)

The reference sample measurement files will be archived in a .7z type file in the SeqRun folder on the USB stick. The name of the file is identical to the Run Order.
When finished, remove the USB drive and put it back into the PC or transfer the files from SeqRun folder to the PC using BIT

Run **PDZ to SSD** to convert and copy the files to the required destination by the Wizard

Run Order is the process Bruker uses internally to run calibration standards. You may use this to create an automatic data collector for your instrument

Regardless of whether you do or not, you do need to create a Run Order to tell EasyCal what to expect from your standards, and to define how your calibration will be applied

Run Order Wizard

Run Order Wizard

Purpose
 To create a "run order" file associated with this calibration. A run order is a file that automates the collection of spectra for samples.

How?
 First use Bruker Instrument Tools to **copy the InstrumentDef.IDF** file from the instrument to the base folder of your EasyCal program. For example to "C:\Users\John\My Documents\Bruker\S1Cal\". If you have a Tracer 5ⁱ you will also need to **copy \Bruker\System\ManualFilters.csv** to your base folder.

Then click on **Run Order Wizard** and ApplicationWizard will open Run Order Wizard for you. Once open, choose the appropriate settings and click "OK".

The run order file has a ".csv" extension. It will be saved in the location indicated at the top of the Run Order Wizard program in a folder with the same name as the Calibration. For example "C:\Users\John\My Documents\Bruker\S1Cal\Alloys\Alloys.csv". Note that there are two additional files created in the same directory- S1-LineLibrary.xrd and S1-LineLibrary.csv.

Copy your run order file into a folder called "RunOrders" on a USB drive. You can do this using a file manager or a BIT explorer with the USB inserted on the instrument and the instrument connected to the PC.

Insert the USB drive into the instrument.

Use the Run Order utility on the instrument to collect data from your samples. (Ready)

The reference sample measurement files will be archived in a .7z type file in the SeqRun folder on the USB stick. The name of the file is identical to the Run Order. When finished, remove the USB drive and put it back into the PC or transfer the files from SeqRun folder to the PC using BIT Explorer.

Run **PDZ to SSD** to convert and save the calibration to the SSD.

Run Order Wizard

Could not open W:\Workshop Large\All Calibrations\Tracer 5i\Example Tracer\Illuminations.dat. This is normal on the first run.

OK

The first time you do a Run Order Wizard, it will look for Illuminations.dat - this is a file that stores your preferred voltage/current/filter/atmosphere selections. It will create one the first time you use the software. Click OK

Click on the red forward > button and move to the next step

File Explorer window showing the contents of a folder named "Example Tracer".

Name	Date modified	Type	Size
50 kV	5/1/18 10:36 AM	File folder	
RunOrders	5/1/18 10:44 AM	File folder	
S2	5/1/18 10:14 AM	File folder	
Std SSD	5/1/18 10:14 AM	File folder	
Illuminations.dat	5/1/18 10:44 AM	DAT File	1 KB
InstrumentDef.idf	1/3/17 4:07 PM	IDF File	70 KB

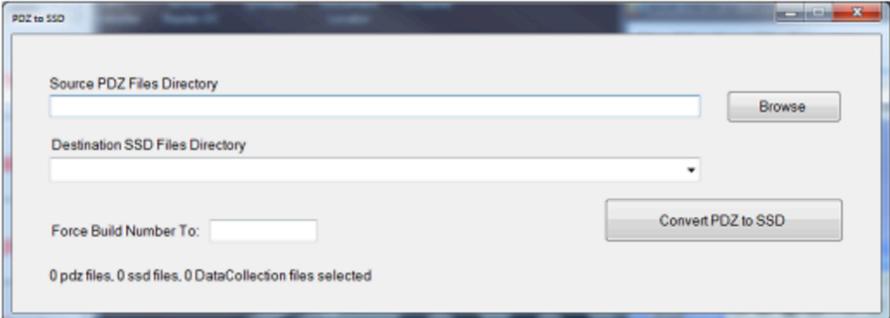

RunOrders Date modified: 5/1/18 10:44 AM Offline status: Online
File folder Offline availability: Not available

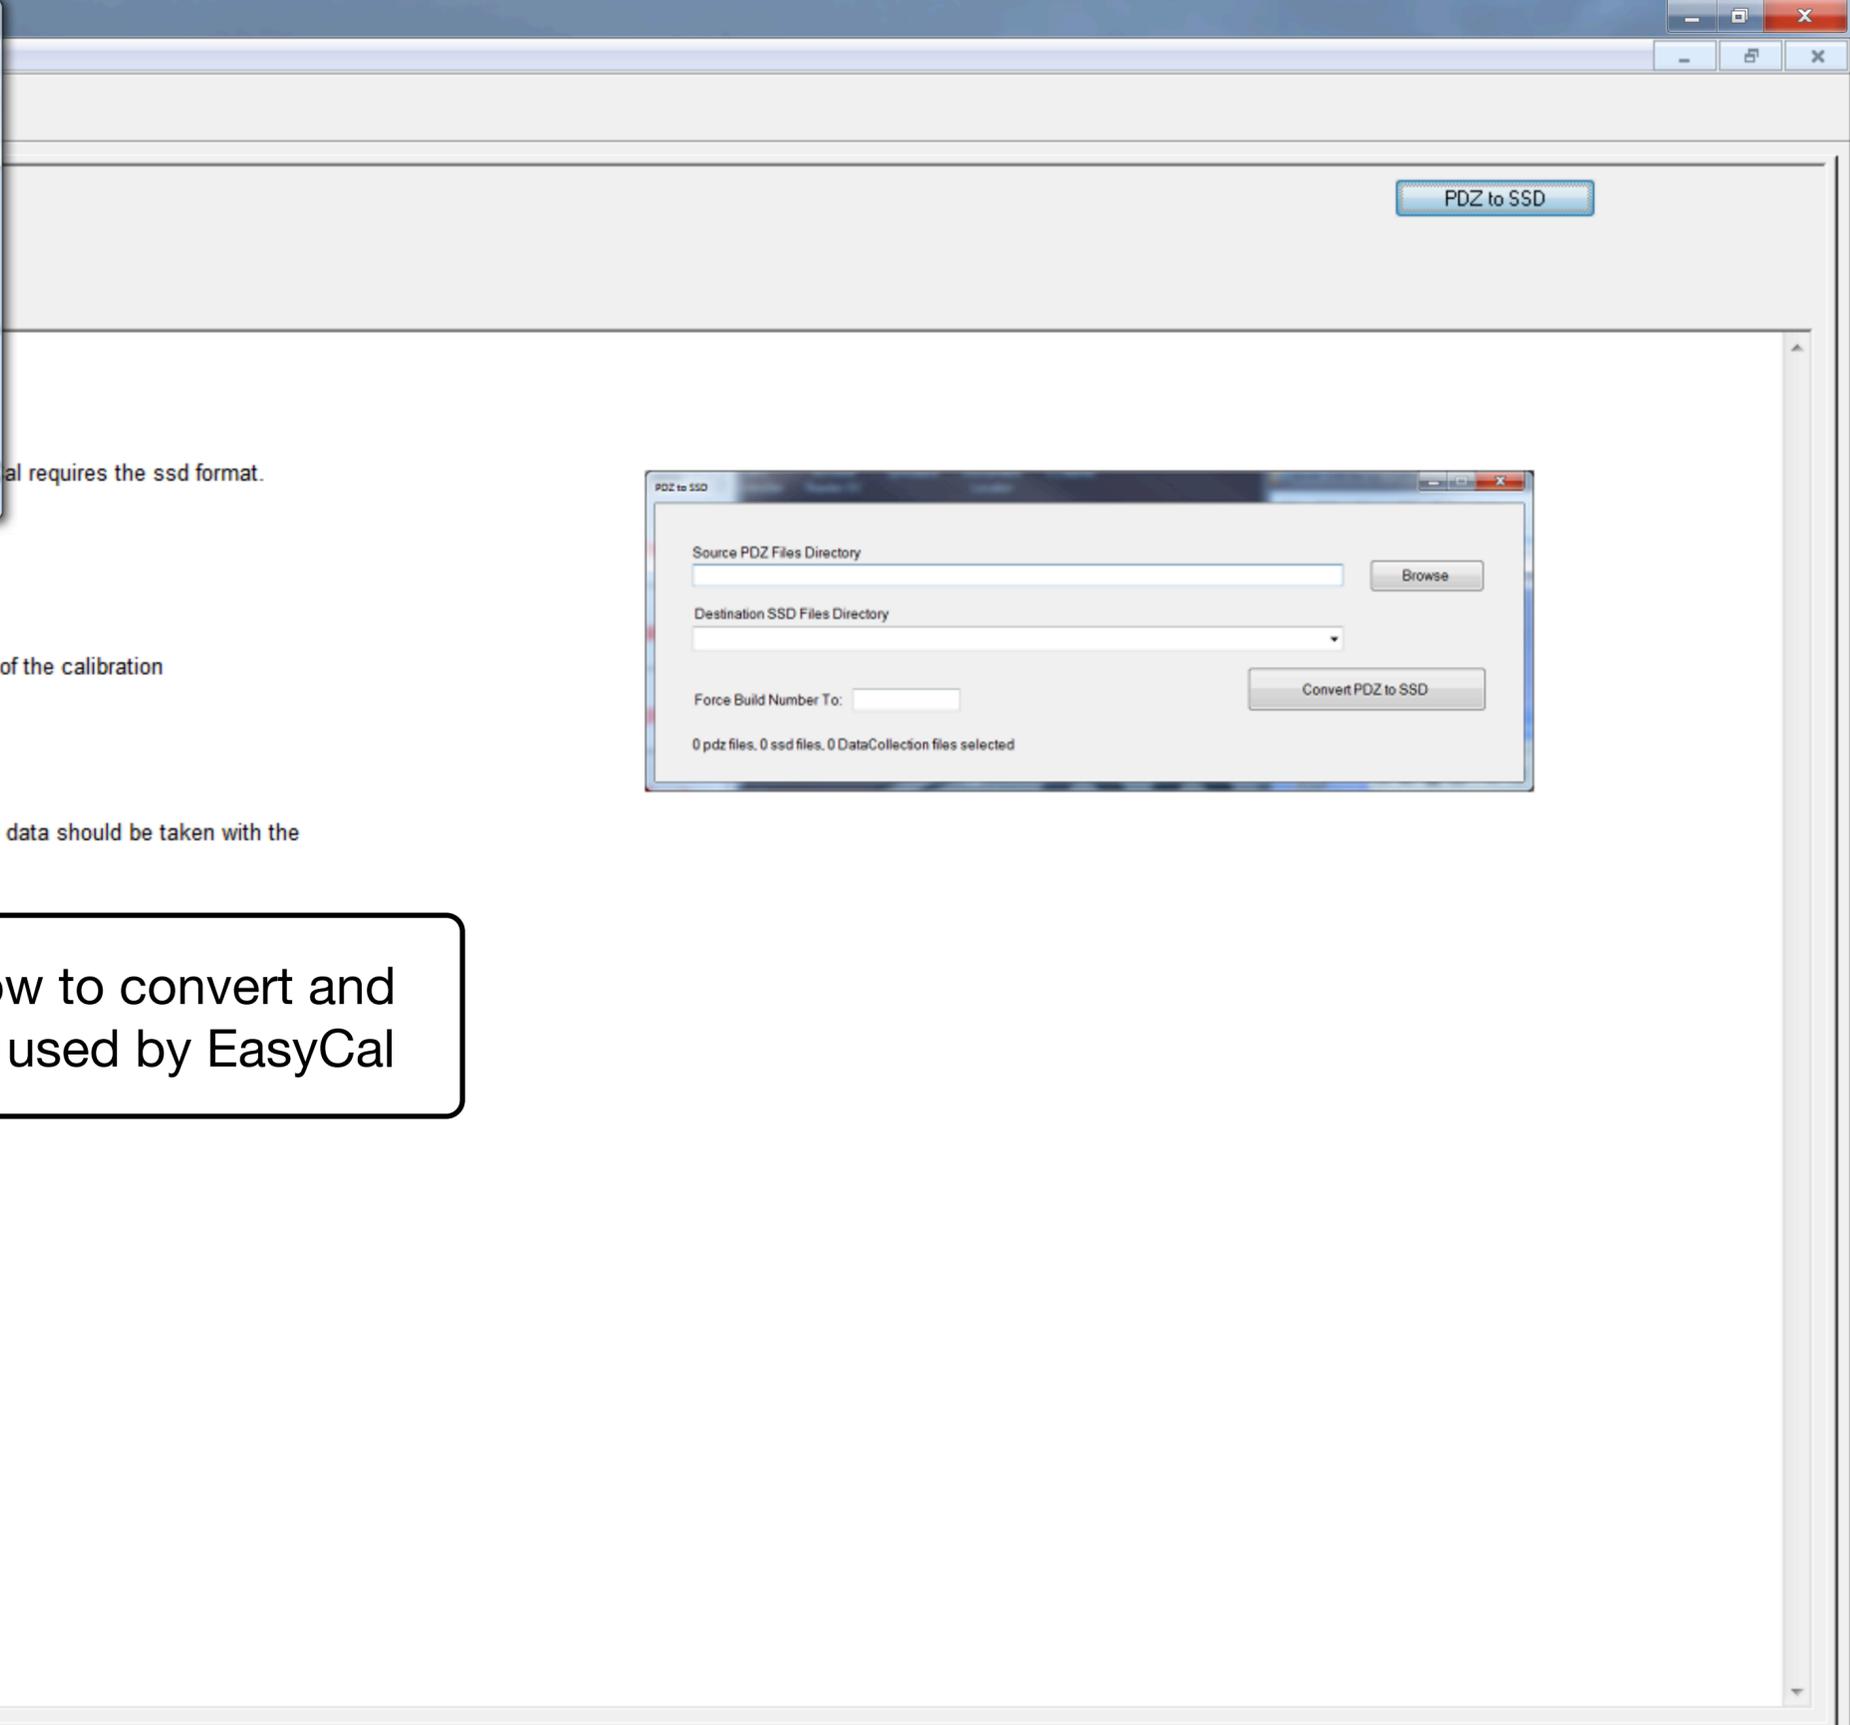

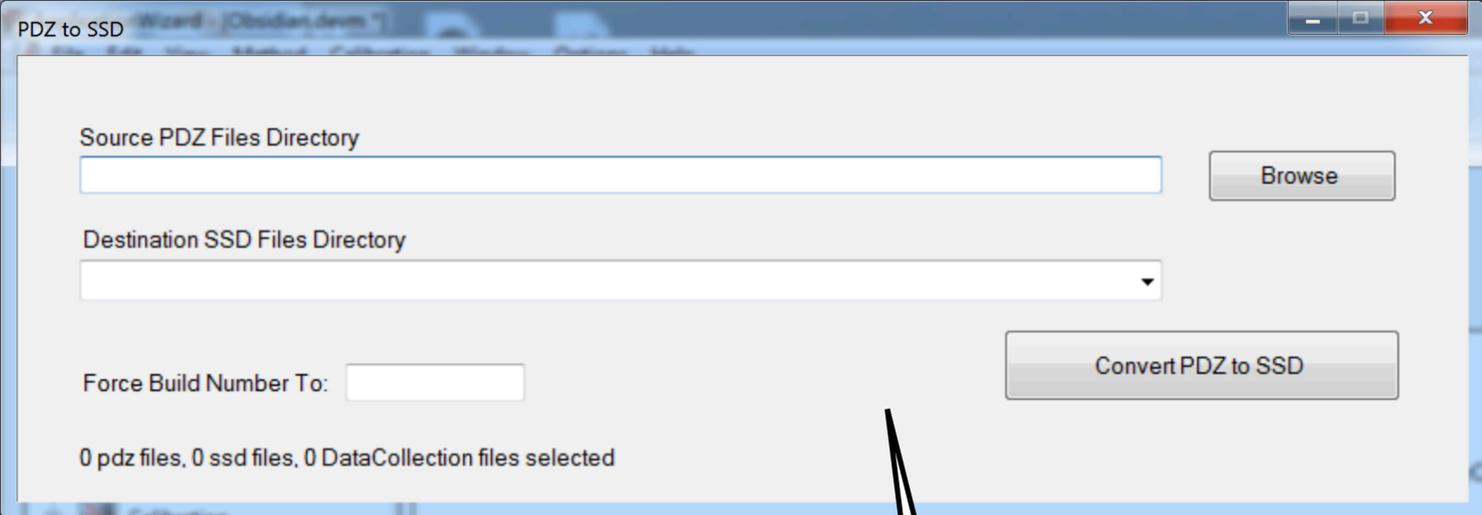

When you are done, you will see both a RunOrders folder and an Illuminations.dat file, these are crucial in creating the calibration

Click on *PDZ to SSD*

On *PDZ to SSD*, we convert any PDZ files to SSD files. This process also automatically sorts your data to be useable by the app

This opens a window to convert and organize files to be used by EasyCal

PDZ to SSD

Source PDZ Files Directory

Destination SSD Files Directory

Force Build Number To:

0 pdz files, 0 ssd files, 0 DataCollection files selected

Start by clicking *Browse* to find your spectra

Navigate to the folder that has these files - I make a point to keep all files relevant to the calibration in the calibration folder itself

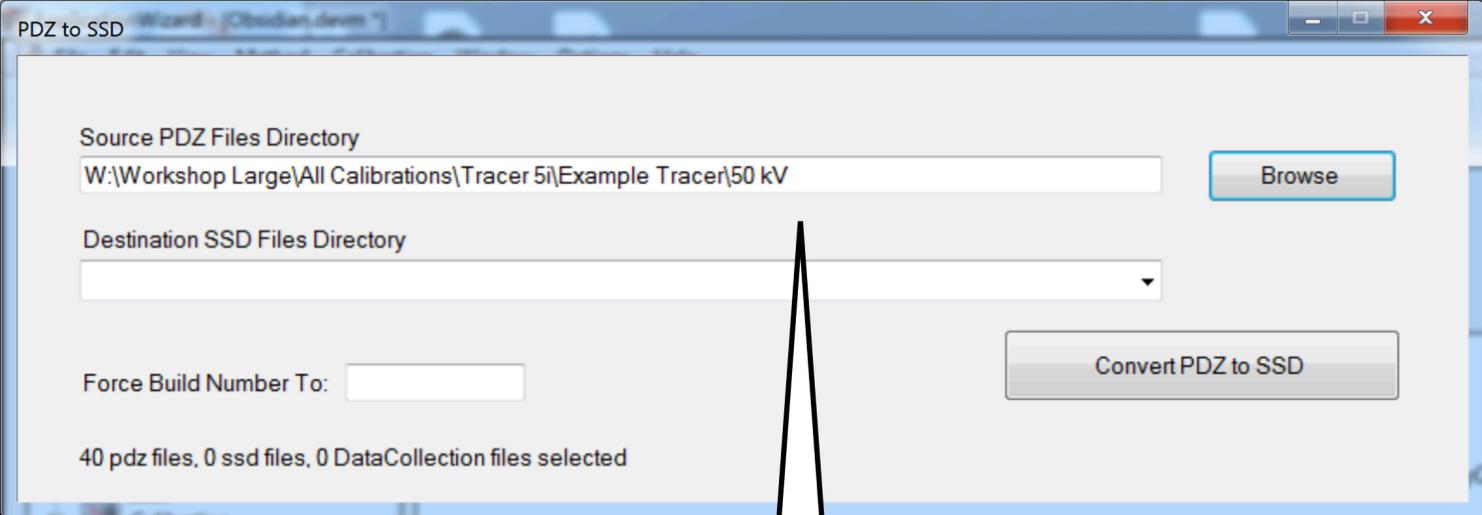

Browse For Folder

PDZ to SSD

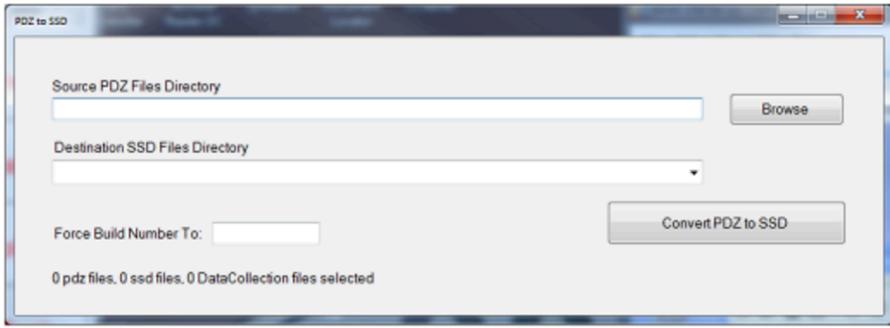

Source PDZ Files Directory

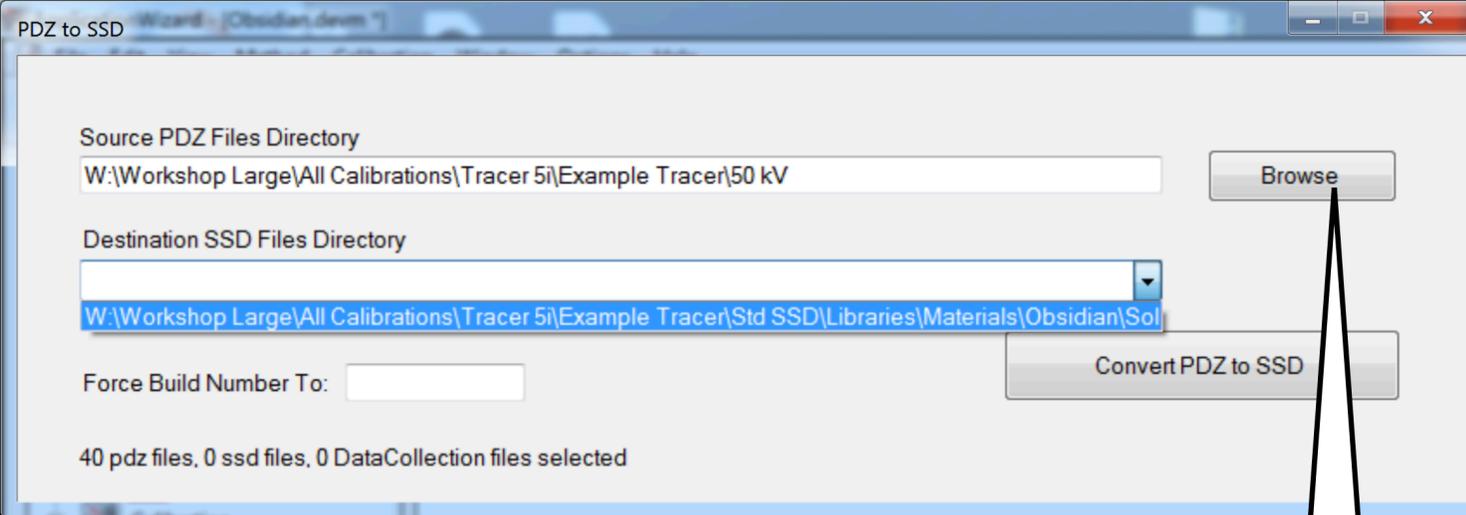

Destination SSD Files Directory

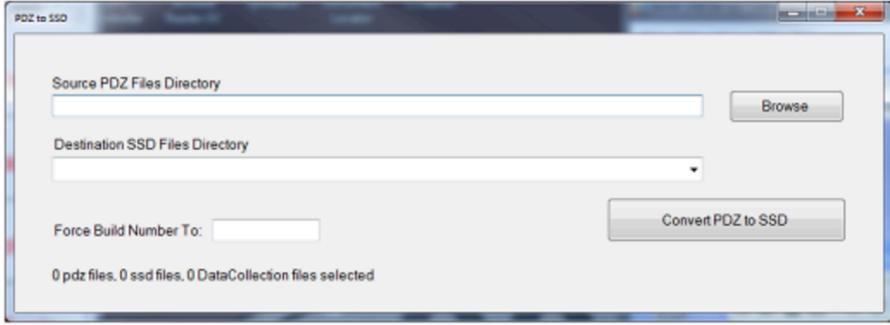

You will see that folder's path in the window. The number of PDZ files in that directory will be in the lower left

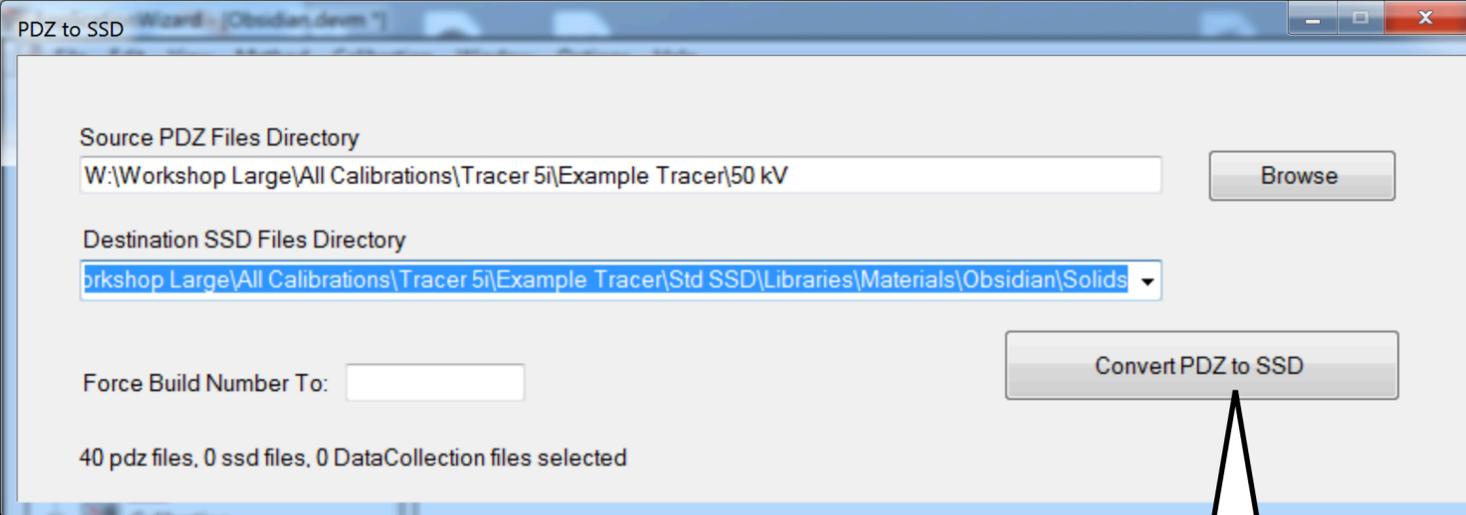

You don't have to use folders - the *Source PDZ Files Directory* can also open up compressed .7z folders produced automatically by the instrument.

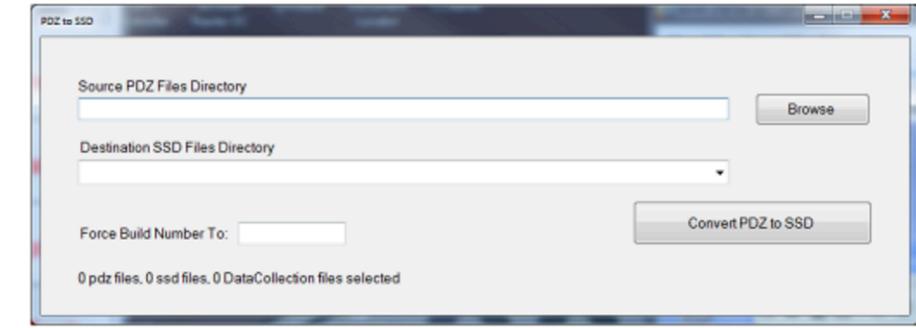

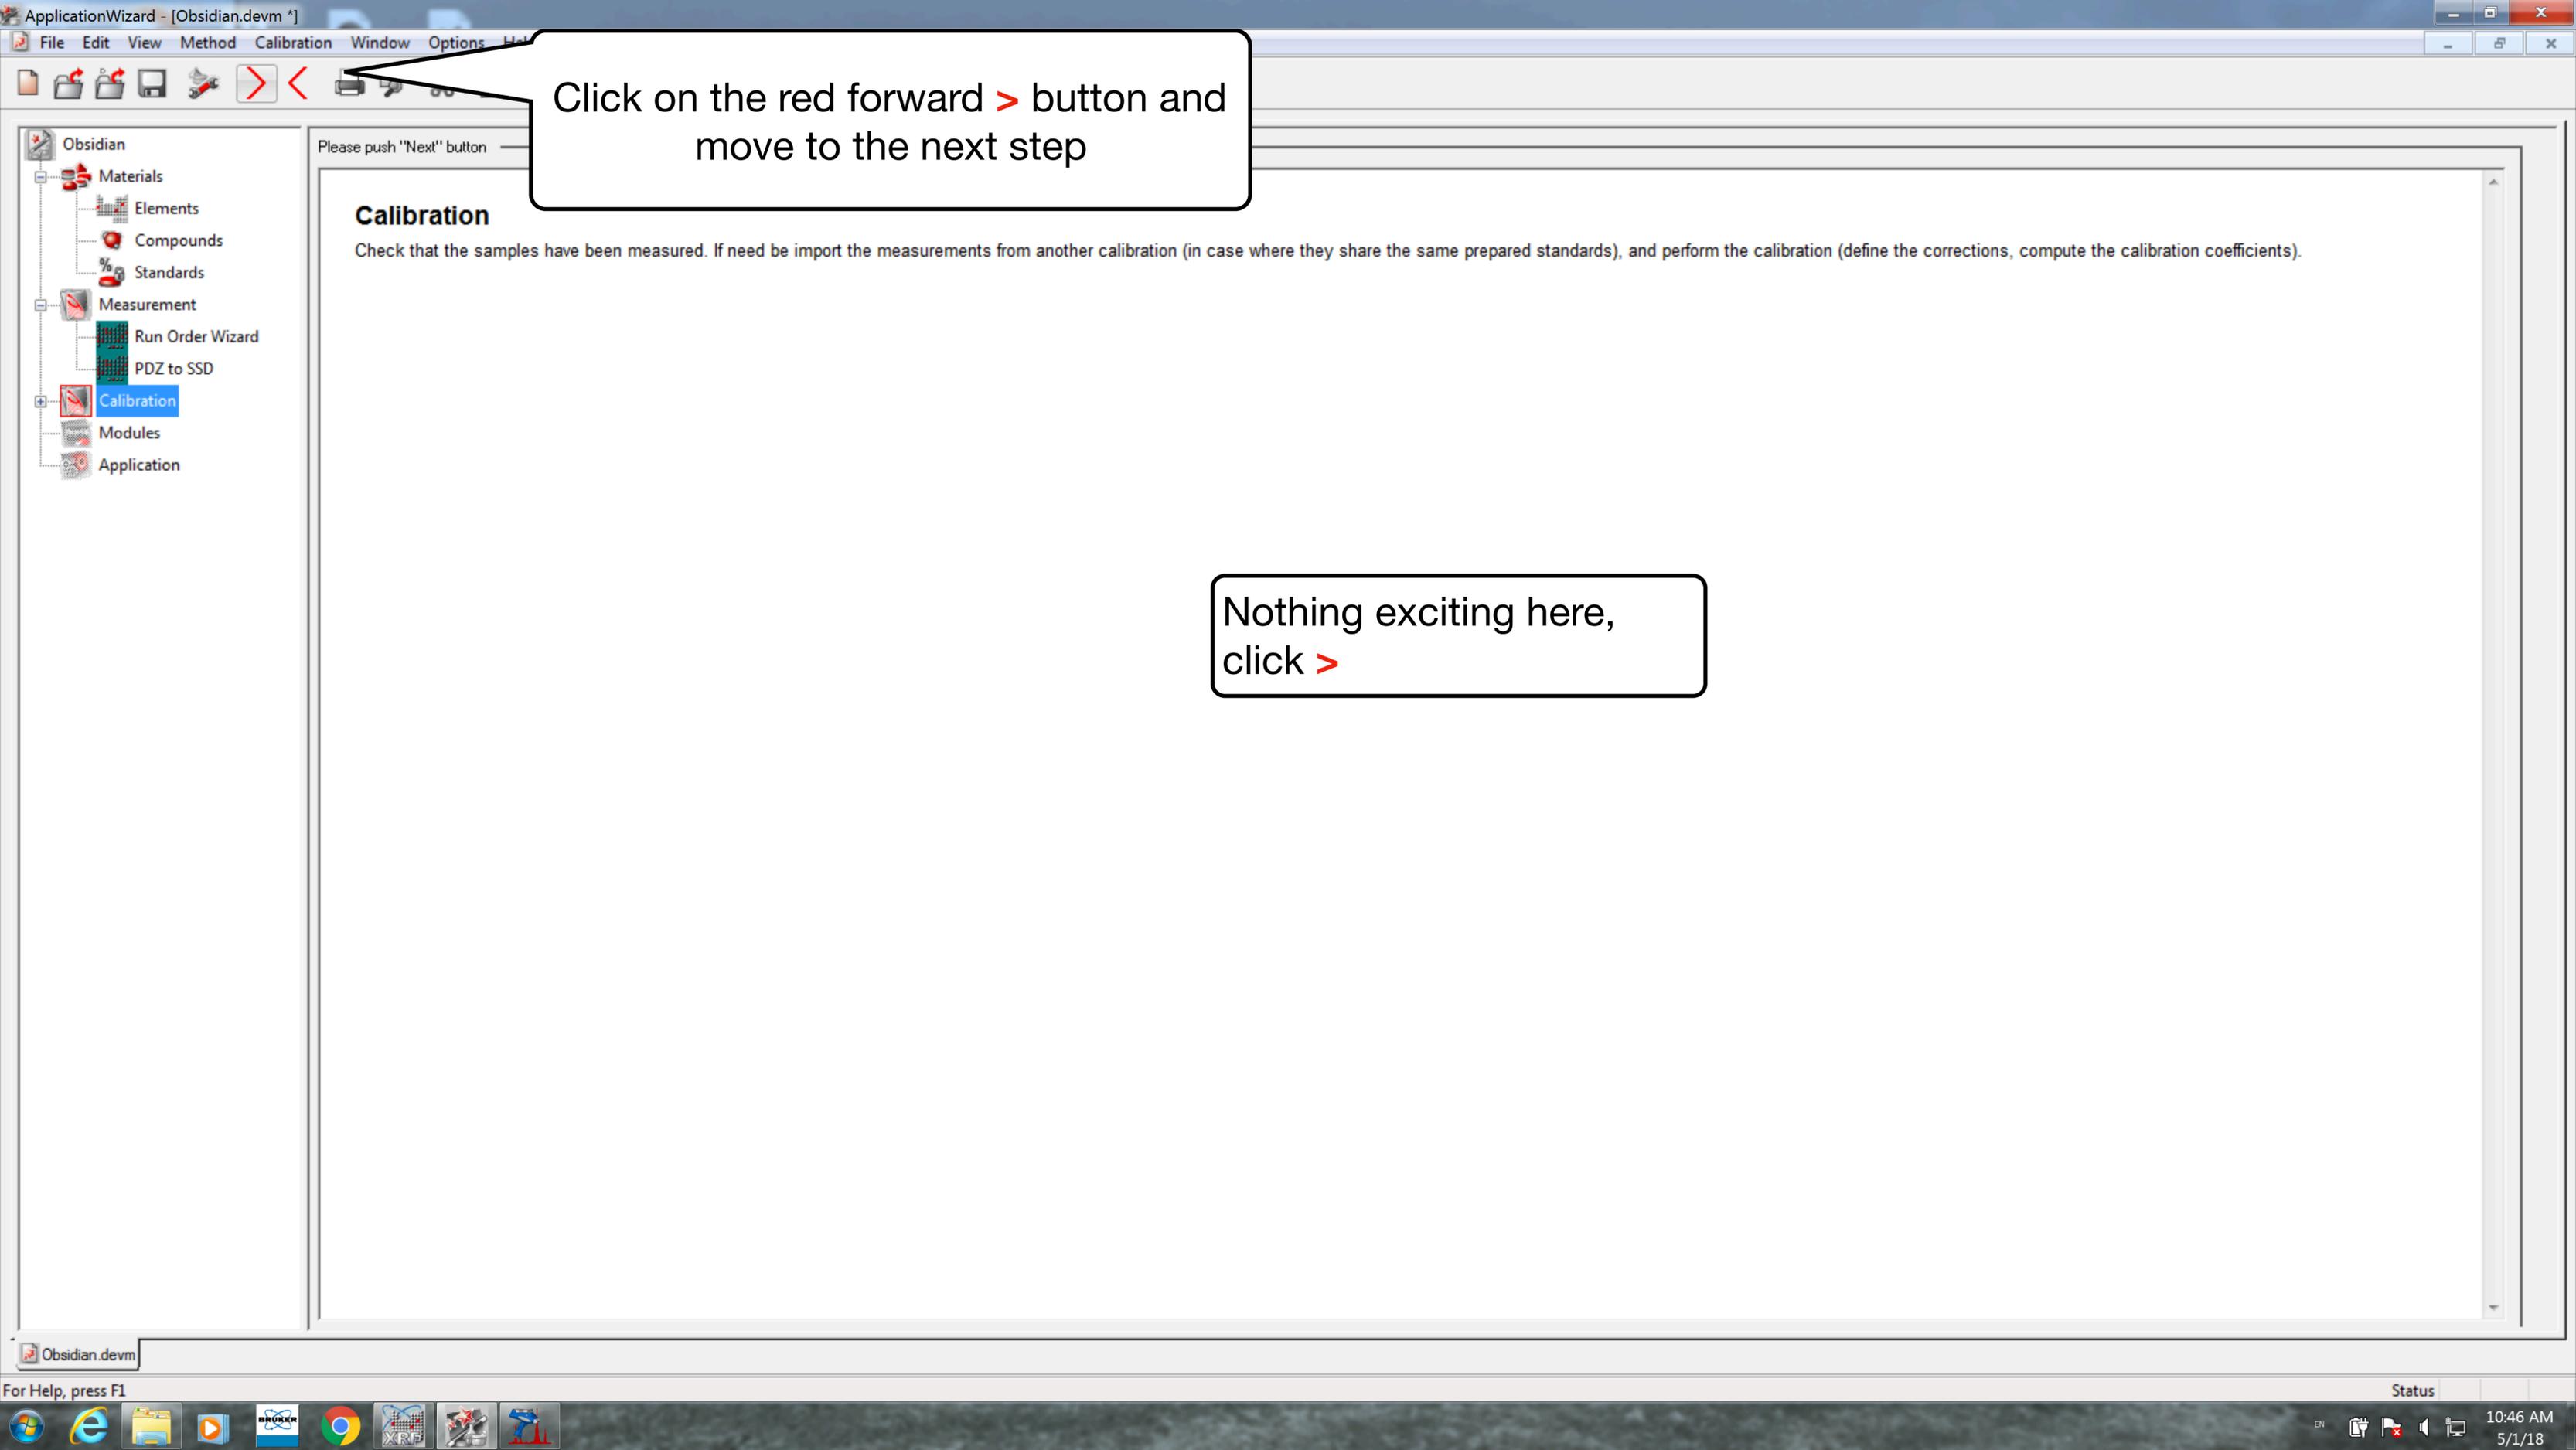

Next, click the down arrow and choose the folder for your calibration. There is only one now, but each new calibration will add one to this list

When you have selected both a source and destination folder, you can then click *Convert PDZ to SSD*

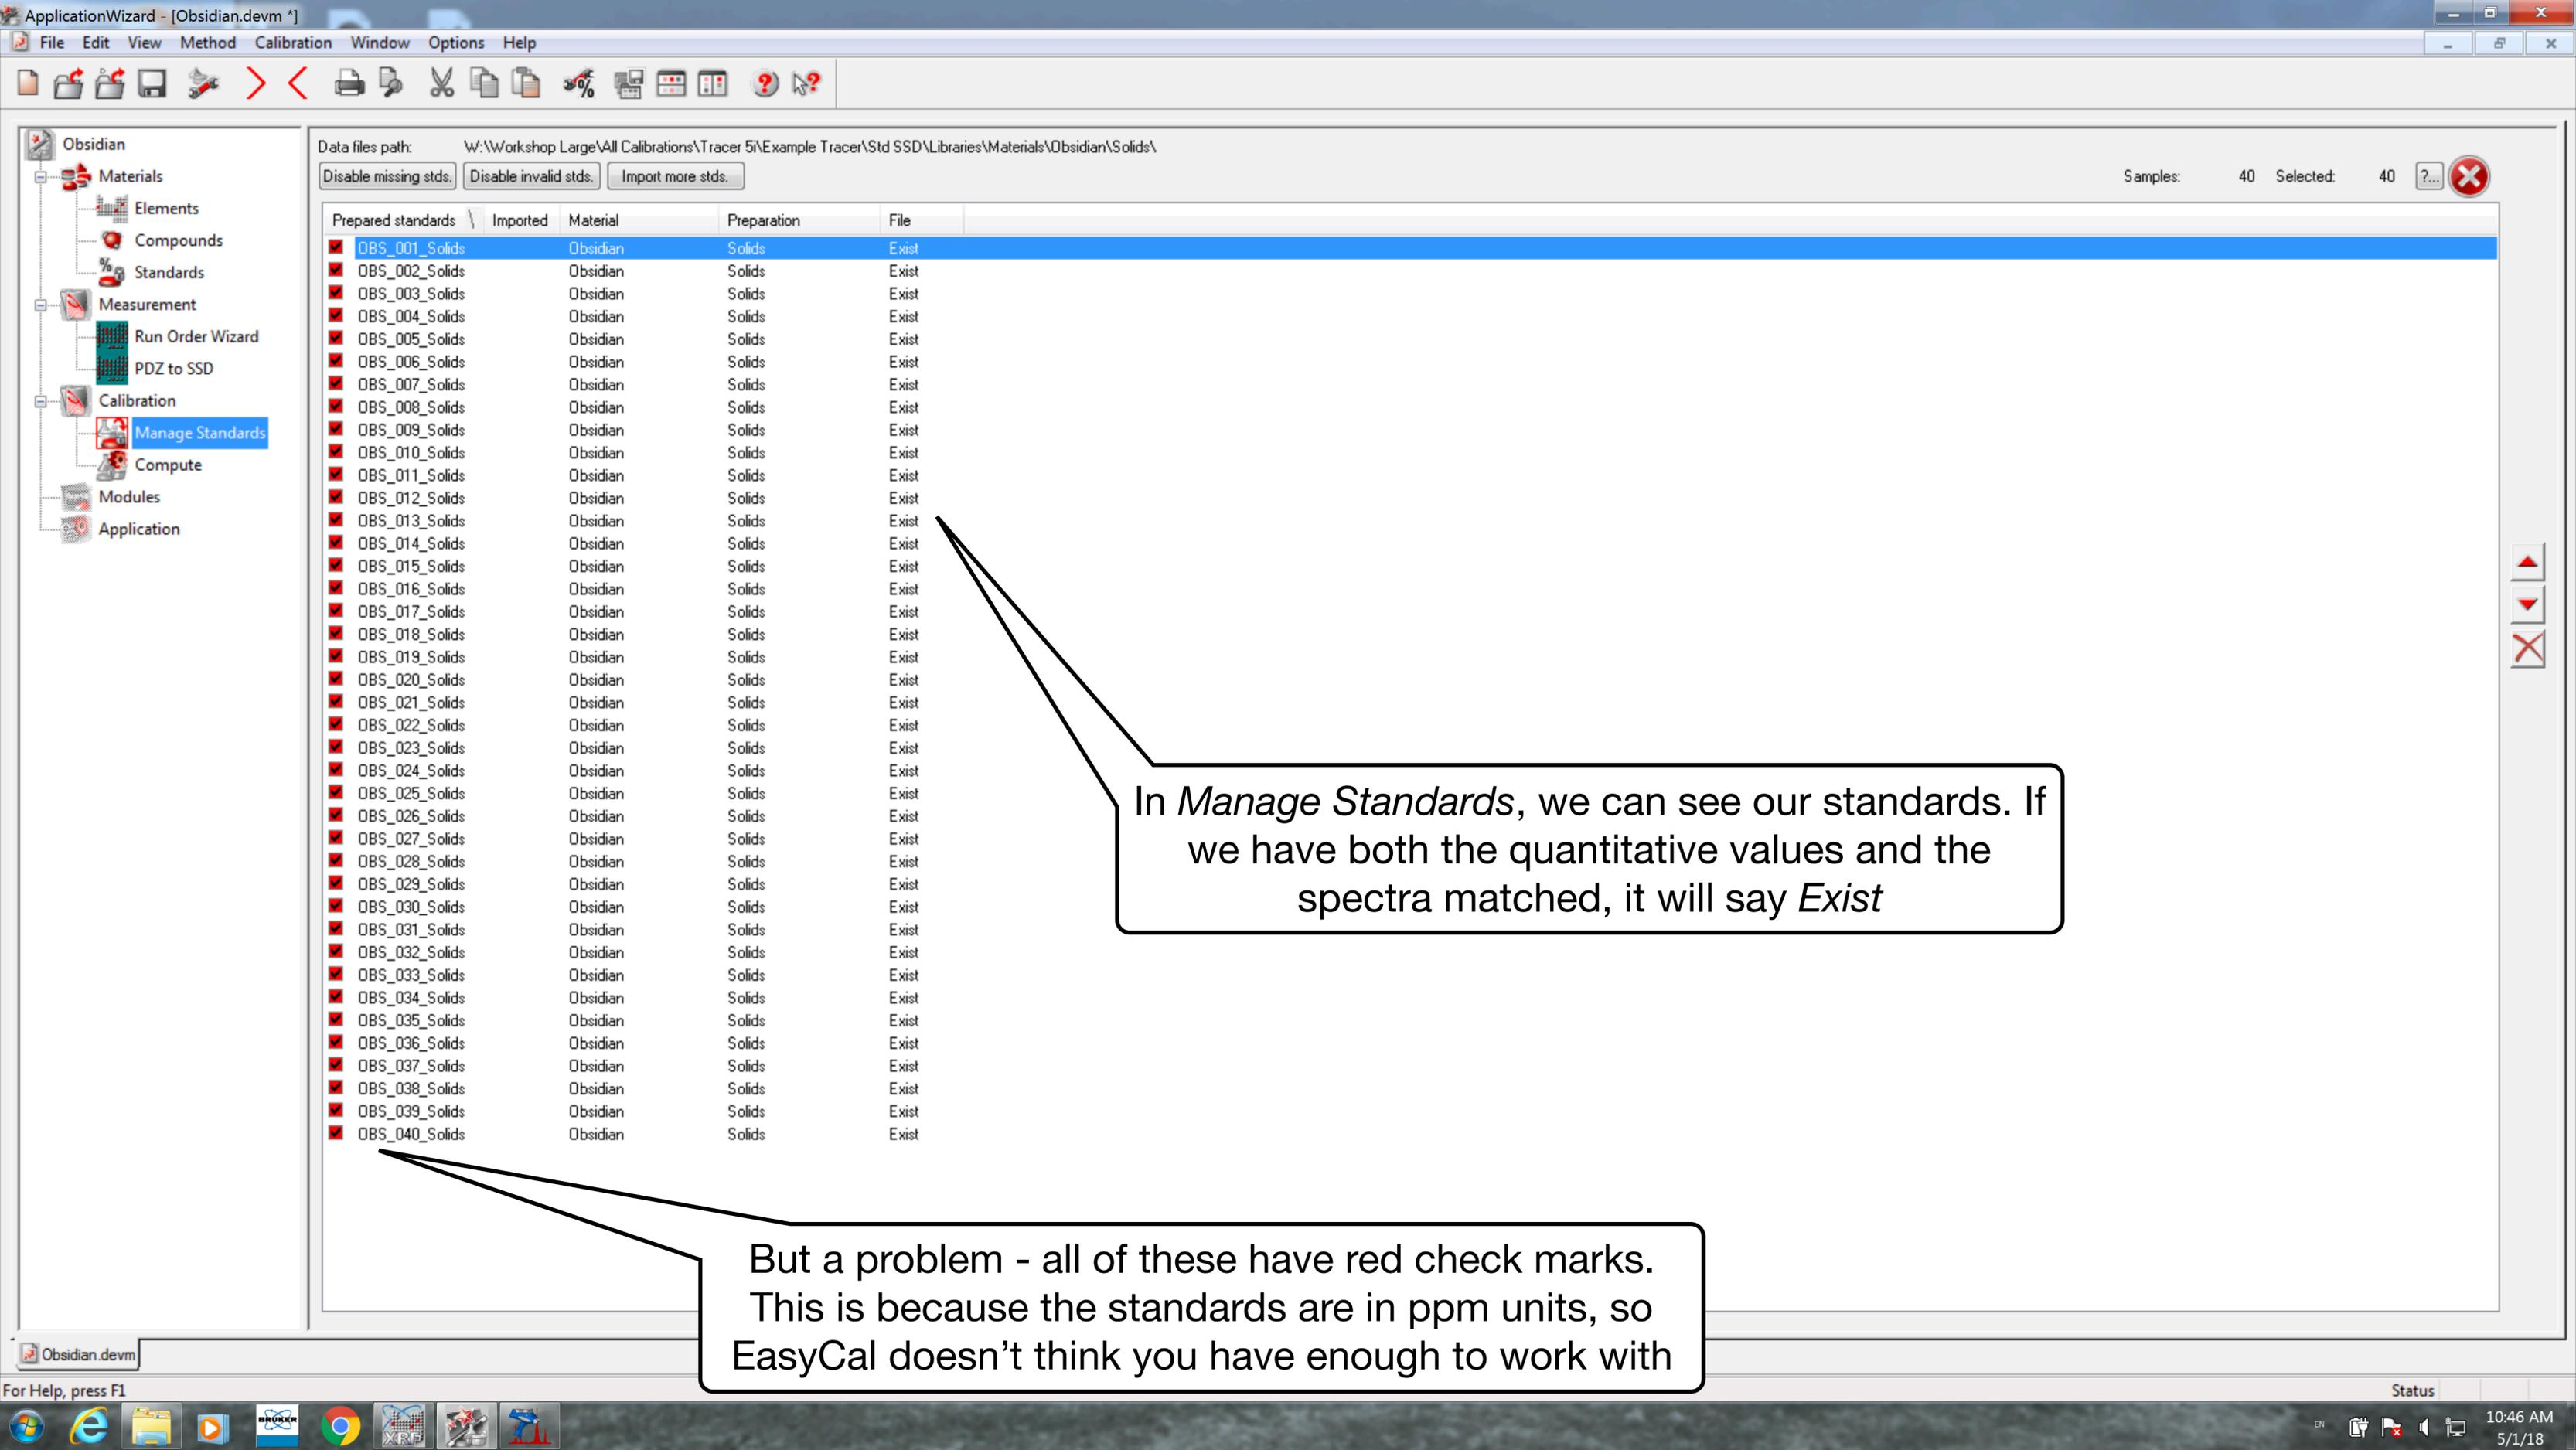

Click on the red forward > button and move to the next step

Nothing exciting here, click >

Please push "Next" button

Calibration

Check that the samples have been measured. If need be import the measurements from another calibration (in case where they share the same prepared standards), and perform the calibration (define the corrections, compute the calibration coefficients).

Data files path: W:\Workshop Large\All Calibrations\Tracer 5\Example Tracer\Std SSD\Libraries\Materials\Obsidian\Solids\

Disable missing stds. Disable invalid stds. Import more stds.

Samples: 40 Selected: 40

In *Manage Standards*, we can see our standards. If we have both the quantitative values and the spectra matched, it will say *Exist*

But a problem - all of these have red check marks. This is because the standards are in ppm units, so EasyCal doesn't think you have enough to work with

To fix this, go back to *Standards*. There, you will see a red *Limits* mark which shows that EasyCal is expecting values ranging from 1% to 105%. The low effective concentration of ppm data means that the sum of all elements is below 1% in all cases

We are now ready to begin creating the calibration. There are a number of options you can consider

-  **Internal Standard** (normalization): You can normalize by time or Compton (18.4 - 19.4 keV)
-  **Line Overlap**: You can subtract an element which has a fluorescence line overlap with another.
-  **Alphas** (slope corrections): You can use an element as a predictor in the event it influences the element's fluorescence
- Offset**: This ground the calibration, and in most other calibration software is the default setting
- Quadratic**: This uses a second-order polynomial, rather than linear, regression

To begin, add the *Offset* correction. I recommend doing this for all elements, but evaluate its effect, there may be some cases that this correction is not desirable

	None
	Sum of Intensities
	Compton (Rh)
	User ROI

Min:

By changing this to *Compton (ROI)*, we improve the cal.
 Note: You will need to change this for every single element.
 In EasyCal, having different elements with different normalizations will lead to odd behavior on the unit itself

There are a couple data points that fall well off this curve. While Yttrium is easy to measure with XRF, it is harder to analyze with other methods. To remove these values, you can double-click them on the *Graph Display Window*

If you want to see more information about any point in the *Graph Display Window*, just hover your mouse over the point, and a window will pop up with information. Helpfully, the window also lists potential influences on that element

Sum of Intensities

This element's calibration requires more work - this is an instance where slope corrections would be helpful. Click on the *Alphas* button

This helps, but the calibration line still needs attention. Unfortunately, a *Slope Correction* doesn't help

Periodic table showing 'Compton' selected under Zr.

NOTE: The only reason the Quadratic correction works is because one point is higher than the others. I strongly advise you do not use Quadratic fixes in general, and for this model in particular. The calibration will always be better if you remove the point in question

However, this will also mean that the calibration range is lower - the only reason to not do this is if you expect values in that range. Just be aware that there could be errors in the application of the calibration model in this instance

By now, we've got the hang of it. Niobium only requires a correction to Zirconium (the highest peak in the spectrum generally for obsidian samples)

Current material : Obsidian
Current preparation : Solids

Application

Purpose

Creation of the evaluation model (EVM file) associated to the material.

Overview

The evaluation model has two roles. The first one is to link the different files of a method (FCL, MM, WZM, MLB). The second one is to define hypotheses on the unknown sample: matrix (i.e. compound not measured but estimated but is considered to be the same amongst all samples), normalization etc.

How?

The maintenance of evaluation models is made by an external program called ApplicationSetup.

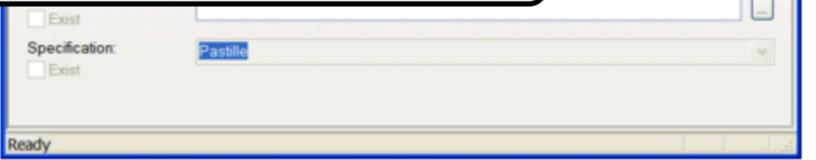

If the default evaluation model for the current material does not already exist, click on **Create** and it will be automatically created. To view or modify the default model, click on **Edit** and ApplicationWizard will open ApplicationSetup for you.

Note

The matrix (100%-sum of the other compounds) can be set at the **Material** level (select **Column Balance** for the compound at the **Standard Materials** step). This works when the standards have the same matrix as the unknown; if it is not the case (e.g. the standards are dry but the unknowns are hydrated), define the matrix in the evaluation model.

It is now time to save the final version of your calibration. This will both create the .evm file that you can use to modify the calibration in the future. It will also create the .appinstall file that you can upload to your Tracer or Titan to automatically calibrate data you collect

Application status

Rb KA1/Obsidian does not have calibration compatible drift correction data.
Sr KA1/Obsidian does not have calibration compatible drift correction data.
Y KA1/Obsidian does not have calibration compatible drift correction data.
Zr KA1/Obsidian does not have calibration compatible drift correction data.
Nb KA1/Obsidian does not have calibration compatible drift correction data.
Th LA1/Obsidian does not have calibration compatible drift correction data.
Rh KA1/Obsidian Compton not calibrated.
Rh KA1/Obsidian Compton does not have calibration compatible drift correction data.
No display method (WZM file) specified.

Warnings for the calibration will be presented here. Don't worry about "compatible drift correction data", as it is irrelevant to the Tracer and Titan. Don't worry about any errors for Rh.KA1 - it is included automatically

What to watch for are negative slopes - these are calibration curves that are not functioning properly. Fortunately, we don't have any here

Zr KA1/Obsidian does not have calibration compatible drift correction data.
Nb KA1/Obsidian does not have calibration compatible drift correction data.
Th LA1/Obsidian does not have calibration compatible drift correction data.
Rh KA1/Obsidian Compton not calibrated.
Rh KA1/Obsidian Compton does not have calibration
No display method (WZM file) specified.

There are two methods to install the calibration's *.appinstall* file on your instrument

1. Go to *Bruker Instrument Tools (BIT)*, go to *Tools*, select *Bruker Installer*. Then *Upload* the *.applinstall* file, then click *Install*. You will be prompted to reboot your instrument
2. Put the *.appinstall* on a *USB* drive, then plug it into your instrument. On the Instrument, go to *Utilities*, then *File Explorer*. Navigate to your *USB* and select the *.appinstall* file. Click the *Copy* button at the top of the screen. Then click the *Up One Folder Level* button. Navigate to the *Bruker* folder then to *package* folder. Click the *Paste* button, then reboot the instrument

You can always access a calibration you created.
To do so, go to *File* and *Open Application*

Open

Application

Purpose

Creation of the evaluation model (EVM file) associated to the material.

Overview

The evaluation model has two roles. The first one is to link the different files of a method (FCL, MM, WZM, MLB...) together. This is not...
The second one is to define hypotheses on the unknown sample: matrix (i.e. compound not measured but estimated by balance to 100% measured but is considered to be the same amongst all samples), normalization etc.

How?

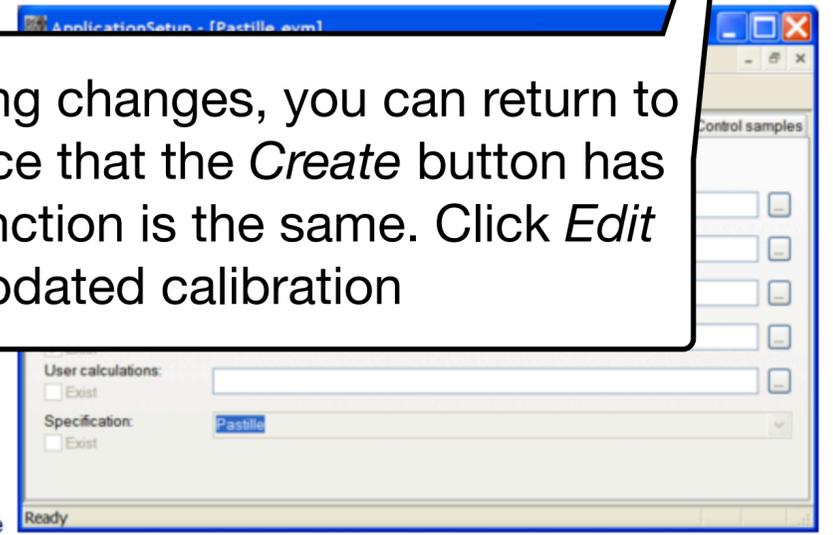

The maintenance of evaluation models is made by an external program called ApplicationSetup.

If the default evaluation model for the current material does not already exist, click on **Create** and it will be automatically created. To view or modify the default model, click on **Edit** and ApplicationWizard will open ApplicationSetup for you.

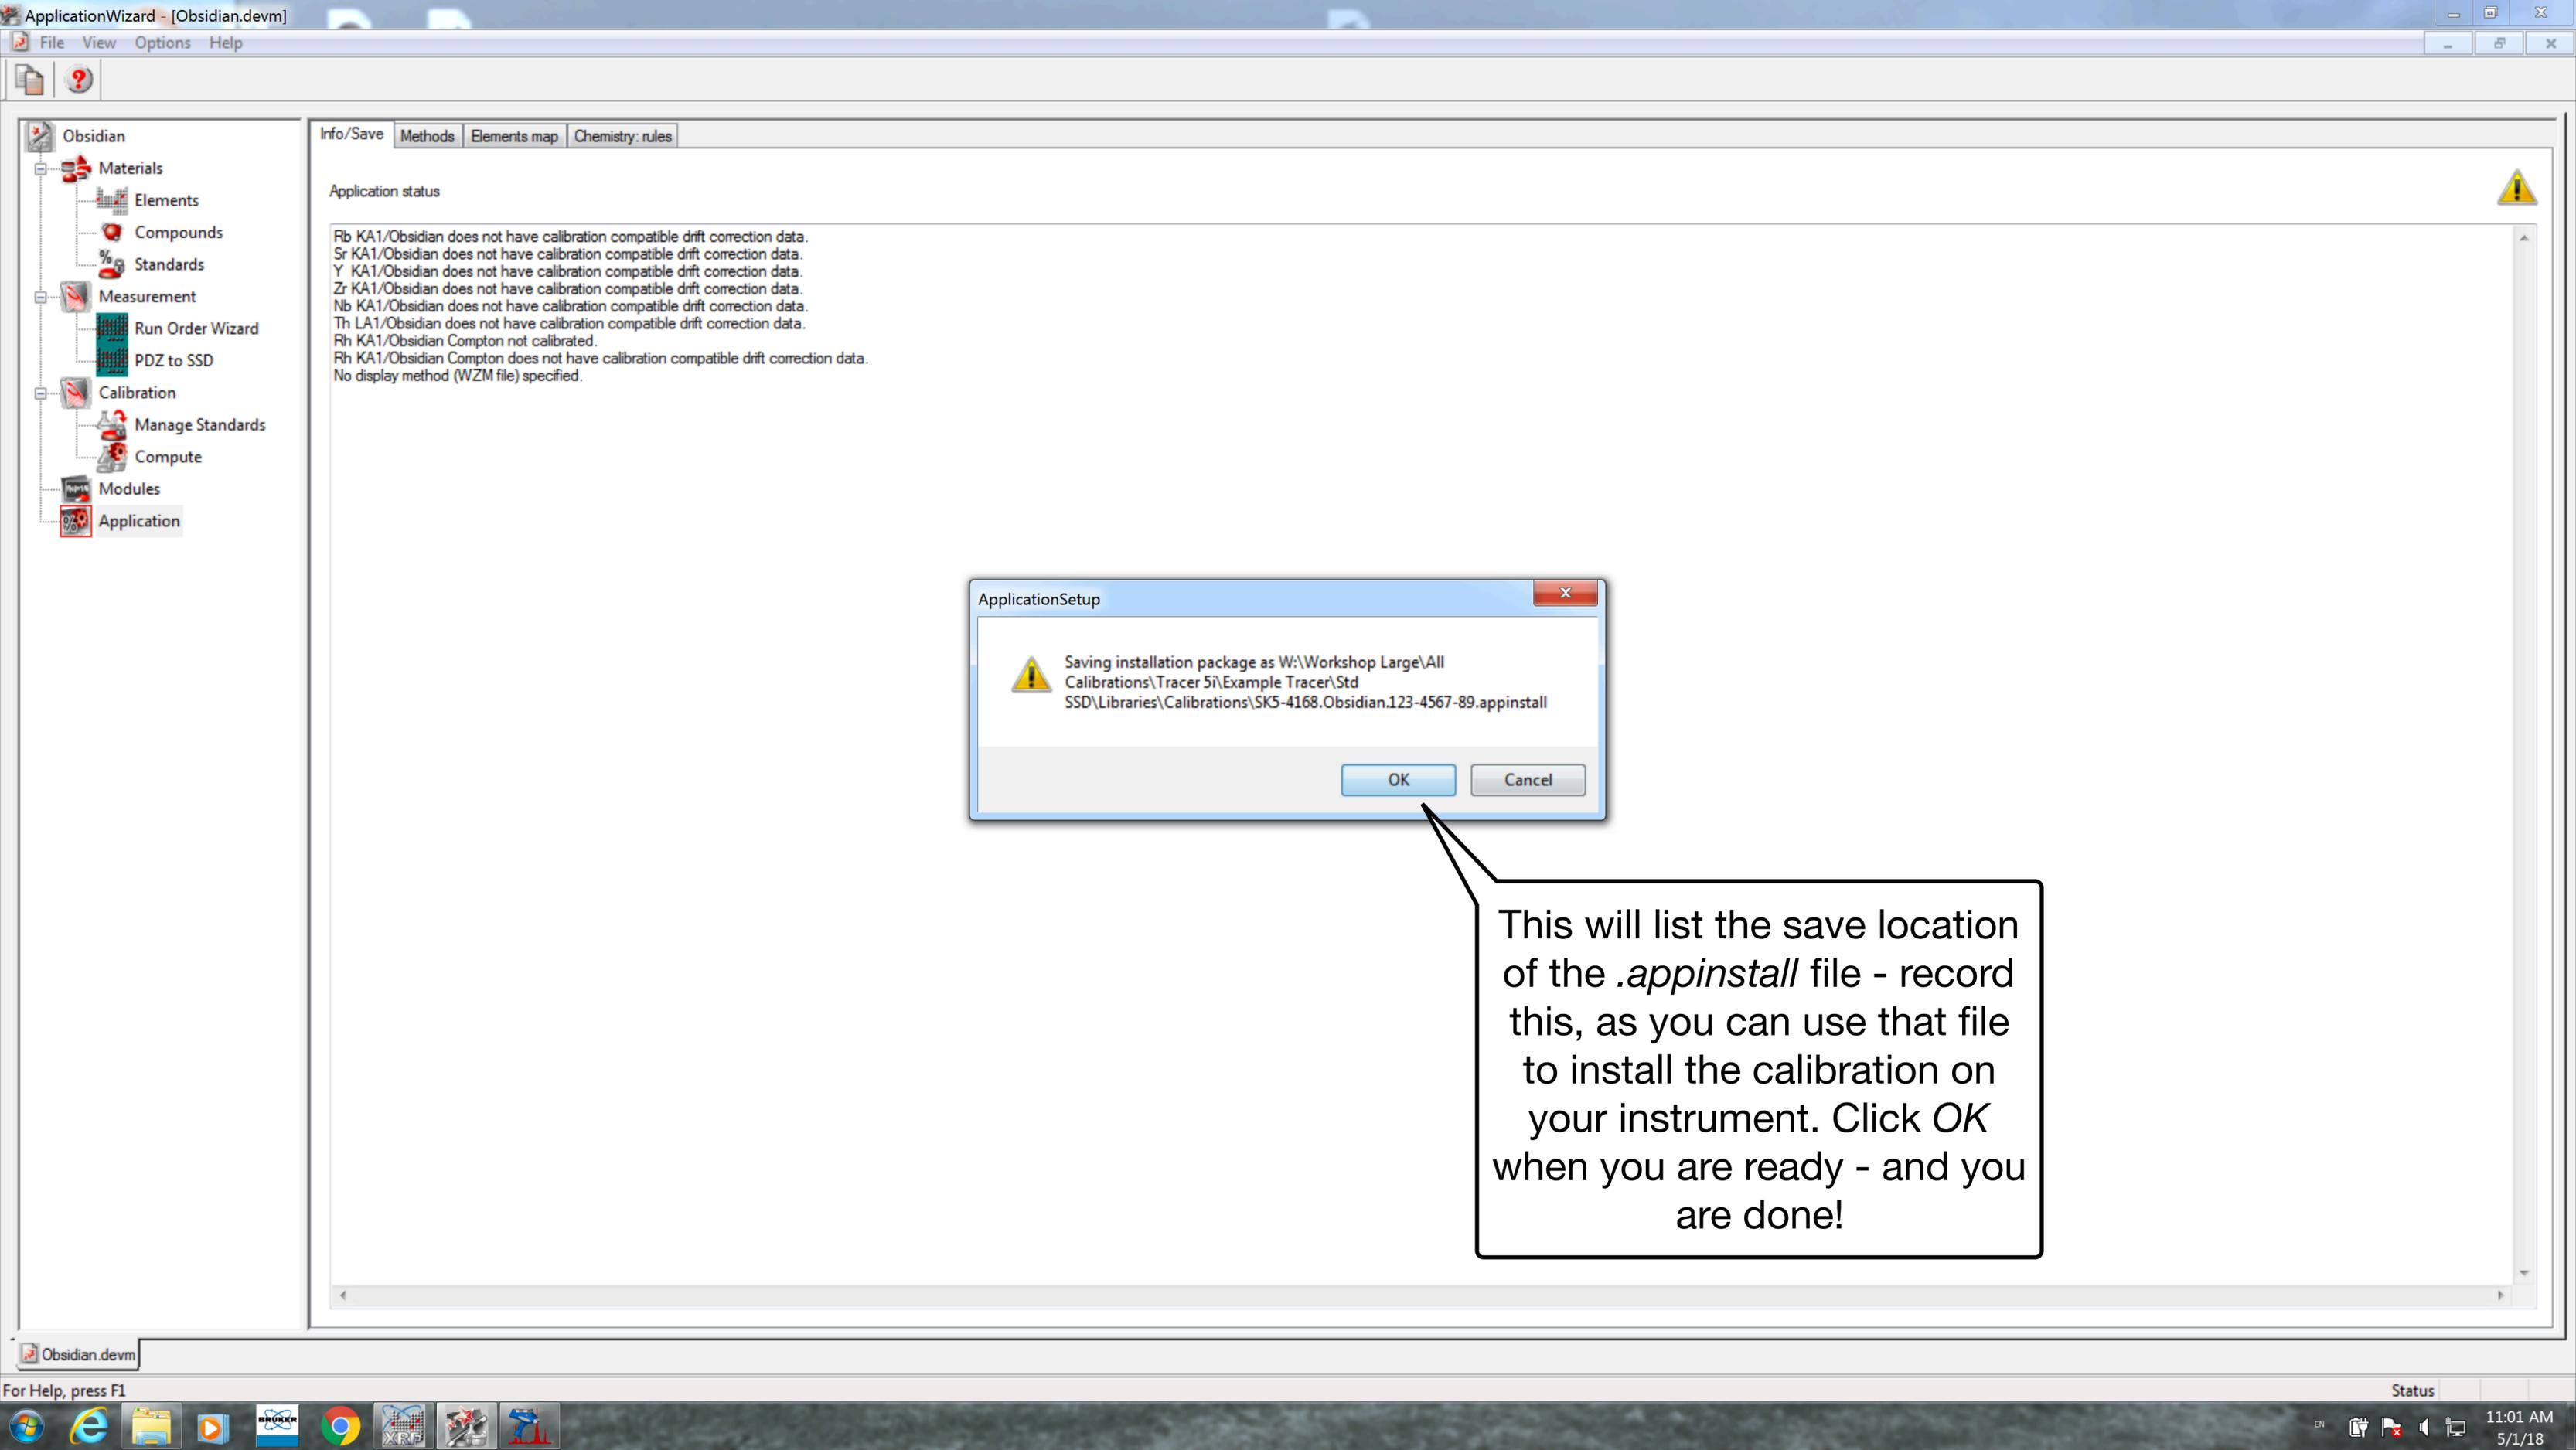

Note

The matrix (100%-sum of the other compounds) can be set at the **Material** level (select **Column Balance** for the compound at the **Standard Materials** step). This works when the standards have the same matrix as the unknown; if it is not the case (e.g. the standards are dry but the unknowns are hydrated), define the matrix in the evaluation model.

When you are done making changes, you can return to *Application*. You will notice that the *Create* button has changed to *Edit* - the function is the same. Click *Edit* to save the updated calibration
